

MC100EP16VS

3.3V / 5V ECL Differential Receiver/Driver with Variable Output Swing

Description

The MC100EP16VS is a differential receiver with variable output amplitude. The device is functionally equivalent to the 100EP16 with an input pin that controls the amplitude of the outputs.

The V_{CTRL} input pin controls the output amplitude of the EP16VS and is referenced to V_{CC} . (See Figure 4.) The operational range of the V_{CTRL} input is from $\leq V_{BB}$ (max output amplitude) to V_{CC} (min output amplitude). (See Figure 3.) A variable resistor between the V_{CC} and V_{BB} pins, with the wiper driving V_{CTRL} , can control the output amplitude. Typical application circuits and a V_{CTRL} Voltage vs. Output Amplitude graph are described in this data sheet. When left open, the V_{CTRL} pin will be internally pulled down to V_{EE} and operate as a standard EP16, with 100% output amplitude.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Features

- 220 ps Propagation Delay
- Maximum Frequency > 4 GHz Typical (See Graph)
- The 100 Series Contains Temperature Compensation
- PECL Mode Operating Range: $V_{CC} = 3.0 V$ to $5.5 V$ with $V_{EE} = 0 V$
- NECL Mode Operating Range: $V_{CC} = 0 V$ with $V_{EE} = -3.0 V$ to $-5.5 V$
- Open Input Default State
- Q Output Will Default LOW with Inputs Open or at V_{EE}
- Pb-Free Packages are Available

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

12. Measured using a 750 mV source, 50% duty cycle clock source. All loading with $50\ \Omega$ to $V_{CC} - 2.0\text{ V}$.

13. Skew is measured between outputs under identical transitions. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.

14. $V_{PP}(\text{min})$ is minimum input swing for which AC parameters are guaranteed.
