

## Features

- 3mm x 3mm LNA/Mixer Solution
- Adjustable LNA and Mixer Current/IIP3
- Meets IMD Tests with Three Gain States/Two Logic Control Pins
- Integrated TX LO Buffer Amplifier
- Full ESD Protection on all Pins

## Applications

- CDMA/JCDMA Cellular Systems
- CDMA450 Handsets/Data Cards
- AMPS Cellular Systems
- General Purpose LNA and Downconverter
- Commercial and Consumer Systems
- Portable Battery-Powered Equipment

Functional Block Diagram

## Product Description

The RF2861 is a receiver front-end for CDMA cellular applications, including JCDMA and CDMA450. It is designed to amplify and downconvert RF signals, using a three gain state LNA to obtain 17 dB of stepped gain control. Features include digital control of LNA gain and power down mode, along with an integrated TX LO buffer amplifier. Another feature of the chip is adjustable IIP3 of the LNA and mixer using off-chip current setting resistors to allow for minimum DC current consumption. Noise figure, IIP3, and other specs are designed to be compatible with the TIA/EIA 98D standard for CDMA cellular communications. The IC is manufactured on an advanced Silicon Germanium Bi-CMOS process and is in a $3 \mathrm{~mm} \times 3 \mathrm{~mm}$, 16-pin, QFN.

## Ordering Information

| RF2861SQ | Sample bag with 25 pieces |
| :--- | :--- |
| RF2861SR | 7" Reel with 100 pieces |
| RF2861TR7 | 7" Reel with 2500 pieces |
| RF2861PCK-410 | 460MHz to 900MHz PCBA with 5-piece sample bag |

## Absolute Maximum Ratings

| Parameter | Rating | Unit |
| :--- | :---: | :---: |
| Supply Voltage | -0.5 to +5.0 | $\mathrm{~V}_{\text {DC }}$ |
| Input LO and RF Levels | +6 | dBm |
| Operating Ambient Temperature | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | -40 to +150 | ${ }^{\circ} \mathrm{C}$ |

ACaution! ESD sensitive device.
Exceeding any one or a combination of the Absolute Maximum Rating conditions ma cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions not implied.

The information in this publication is believed to be accurate and reliable. However, no responsibility is assumed by RF Micro Devices, Inc. ## IF Output Interface Network

## Single-End IF Matching

L1, C1, C2, and R form a current combiner which performs a differential to single-ended conversion at the IF frequency and sets the output impedance. In most cases, the resonance frequency is independent of $R$ and can be set according to the following equation:

$$
f_{I F}=\frac{1}{2 \pi \sqrt{\frac{L 1}{2}\left(C_{1}+2 C_{2}+C_{E Q}\right)}}
$$

Where $\mathrm{C}_{\mathrm{EQ}}$ is the equivalent stray capacitance and capacitance looking into pins 9 and 10 . An average value to use for $\mathrm{C}_{\mathrm{EQ}}$ is 2.5 pF .
$R$ can then be used to set the output impedance according to the following equation:

$$
R=\left(\frac{1}{4 \cdot R_{O U T}}-\frac{1}{R_{P}}\right)^{-1}
$$

where $R_{\text {OUT }}$ is the desired output impedance and $R_{P}$ is the parasitic equivalent parallel resistance of $L 1$.
$\mathrm{C}_{2}$ should first be set to 0 and C 1 should be chosen as high as possible (not greater than 39 pF ), while maintaining an $\mathrm{R}_{\mathrm{P}}$ of L 1 that allows for the desired $\mathrm{R}_{\text {OUT }}$. If the self-resonant frequencies of the selected C 1 produce unsatisfactory linearity performance, their values may be reduced and compensated for by including C2 capacitor with a value chosen to maintain the desired $\mathrm{F}_{\mathrm{IF}}$ frequency.

L2 and C3 serve dual purposes. L2 serves as an output bias choke, and C3 serves as a series DC block.
In addition, L2 and C3 may be chosen to form an impedance matching network if the input impedance of the IF filter is not equal to $\mathrm{R}_{\text {OUT }}$. Otherwise, L2 is chosen to be large (suggested 120 nH ) and C3 is chosen to be large (suggested 22nF) if a DC path to ground is present in the IF filter, or omitted if the filter is DC-blocked.

## Differential IF Matching

L1 and C1 are chosen to resonate at the desired IF frequency. C1 can be omitted and the value of L1 increased and utilized solely as a choke to provide $\mathrm{V}_{\mathrm{CC}}$ to the open-collector outputs, but it is strongly recommended that at least some small-valued $\mathrm{C} 1(\mathrm{a} f \mathrm{w} \mathrm{pF}$ ) be retained for better mixer linearity performance. R is normally selected to match the input impedance of the IF filter. However, mixer performance can be modified by selecting an $R$ value that is different from the IF filter input impedance, and inserting a conjugate matching network between the Resistive Output Network and the IF filter.

C2 serve dual purposes. C2 serves as a series DC block when a DC path to ground is present in the IF filter. In addition, C2 may be chosen to improve the combine performance of the mixer and IF filter. L2 should choose to resonate with the internal capacitance of the SAW filter. Usually, SAW filter has some capacitance. Otherwise, L2 could be eliminated.

A practical approach to obtain the differential matching is to tune the mixer to the correct load point for gain, IIP3, and NF using the single-end current combiner method. Second, use the component values found in the single-end approach as starting point for the differential matching. The two-shunt capacitors in the single-end could be converted in a parallel capacitor and the parallel inductor in the single-end need to be converted in two-choke inductor. Third, set the DC block capacitors (C2) in the differential-end matching to a high value (100pF) and retune the resonate circuit (C1 and L1) and the resistor (R) for optimal performance. After optimal performance is achieved and if performance is not satisfactory, decrease the series capacitors until optimal performance is achieved.

## PCB Design Requirements

## PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is $3 \mu \mathrm{inch}$ to $8 \mu$ inch gold over $180 \mu$ inch nickel.

## PCB Land Pattern Recommendation

PCB land patterns are based on IPC-SM-782 standards when possible. The pad pattern shown has been developed and tested for optimized assembly at RFMD; however, it may require some modifications to address company specific assembly processes. The PCB land pattern has been developed to accommodate lead and package tolerances.

## PCB Metal Land Pattern
