512Kx36 & 1Mx18 SRAM

Document Title

16M DDR SYNCHRONOUS SRAM

Revision History

<u>Rev.No.</u>	<u>History</u>	<u>DraftData</u>	<u>Remark</u>
Rev. 0.0	Initial document.	Oct. 2003	Advance
Rev. 0.1	Change JTAG DC OPERATING CONDITONS/AC TEST CONDITIONS -to support 1.8~2.5V V _{DD} , change some items.	Nov. 2003	Preliminary
Rev. 0.2	Change DC CHARACTERISTICS (Stop Clock Standby Current) -I _{SB1} : 100 -> 150	Feb. 2004	Preliminary
Rev. 0.3	Change JTAG Instruction Cording - For Reserved	Feb. 2004	Preliminary
Rev. 1.0	Change DC CHARACTERISTICS (Increase Operating Current) - x36 : add 40mA, x18 : add 60mA	Mar. 2004	Final
Rev. 1.1	Add DC CHARACTERISTICS - V _{IN-CLK} , V _{DIF-CLK} , V _{CM-CLK} Add AC INPUT CHARACTERISTICS Add INPUT DEFINITION	Jan. 2004	Final

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

K7D163674B K7D161874B

512Kx36 & 1Mx18 SRAM

FEATURES

- 512Kx36 or 1Mx18 Organizations.
- 1.8~2.5V V_{DD}/1.5V V_{DDQ}.(1.9V max V_{DDQ})
- HSTL Input and Outputs.
- Single Differential HSTL Clock.
- Synchronous Pipeline Mode of Operation with Self-Timed Late Write.
- Free Running Active High and Active Low Echo Clock Output Pin.
- Asynchronous Output Enable.
- Registered Addresses, Burst Control and Data Inputs.
- Registered Outputs.
- Double and Single Data Rate Burst Read and Write.
- Burst Count Controllable With Max Burst Length of 4
- Interleaved and Linear Burst mode support
- Bypass Operation Support
- Programmable Impedance Output Drivers.
- JTAG Boundary Scan (subset of IEEE std. 1149.1)
- 153(9x17) Pin Ball Grid Array Package(14mmx22mm)

GENERAL DESCRIPTION

The K7D163674B and K7D161874B are 18,874,368 bit Synchronous Pipeline Burst Mode SRAM devices. They are organized as 524,288 words by 36 bits for K7D163674B and 1,048,576 words by 18 bits for K7D161874B, fabricated using Samsung's advanced CMOS technology.

Single differential HSTL level clock, K and \bar{K} are used to initiate the read/write operation and all internal operations are self-timed. At the rising edge of K clock, all addresses and burst control inputs are registered internally. Data inputs are registered one cycle after write addresses are asserted(Late Write), at the rising edge of K clock for single data rate (SDR) write operations and at rising and falling edge of K clock for a double data rate (DDR) write operations.

Data outputs are updated from output registers off the rising edges of K clock for SDR read operations and off the rising and falling edges of K clock for DDR read operations. Free running echo clocks are supported which are representative of data output access time for all SDR and DDR operations.

The chip is operated with a single +2.5V power supply and is compatible with Extended HSTL input and output. The package is 9x17(153) Ball Grid Array balls on a 1.27mm pitch.

K7D163674B
K7D161874B

512Kx36 & 1Mx18 SRAM

Read Operation(Single and Double)

During SDR read operations, addresses and controls are registered at the first rising edge of K clock and then the internal array is read between first and second rising edges of K clock. Data outputs are updated from output registers off the second rising edge of K clock. During DDR read operations, addresses and controls are registered at the first rising edge of K clock, and then the internal array is read twice between first and second rising edges of K clock. Data outputs are updated from output registers sequentially by burst order off the second rising and falling edge of K clock.

Interleave and linear burst operation is controlled by \overline{LBO} pin and the burst count is controllable with the maximum burst length of 4. To avoid data contention, at least one NOP operations are required between the last read and the first write operation.

Write Operation(Late Write)

During SDR write operations, addresses and controls are registered at the first rising edge of K clock and data inputs are registered at the following rising edge of K clock. During DDR write operations, addresses and controls are registered at the first rising edge of K clock and data inputs are registered twice at the following rising and falling edge of K clock. Write addresses and data inputs are stored in the data in registers until the next write operation, and only at the next write operation are data inputs fully written into SRAM array.

Echo clock operation

Free running type of Echo clocks are generated from K clock regardless of read, write and NOP operations. They will stop operation only when K clock is in the stop mode.

Echo clocks are designed to represent data output access time and this allows the echo clocks to be used as reference to capture data outputs outputs.

Bypass Read Operation

Bypass read operation occurs when the last write operation is followed by a read operation where write and read addresses are identical. For this case, data outputs are from the data in registers instead of SRAM array.

Programmable Impedance Output Driver

The data output and echo clock driver impedance are adjusted by an external resistor, RQ, connected between ZQ pin and Vss, and are equal to $RQ/5$. For example, 250 Ω resistor will give an output impedance of 50 Ω . Output driver impedance tolerance is 15% by test(10% by design) and is periodically readjusted to reflect the changes in supply voltage and temperature. Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles. They may also occur in cycles initiated with \overline{G} high. In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM. Impedance updates occur no more often than every 32 clock cycles. Clock cycles are counted whether the SRAM is selected or not and proceed regardless of the type of cycle being executed. Therefore, the user can be assured that after 33 continuous read cycles have occurred, an impedance update will occur the next time \overline{G} are high at a rising edge of the K clock. There are no power up requirements for the SRAM. However, to guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

Power-Up/Power-Down Supply Voltage Sequencing

The following power-up supply voltage application is recommended: Vss, VDD, VDDQ, VREF, then VIN. VDD and VDDQ can be applied simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: VIN, VREF, VDDQ, VDD, Vss. VDD and VDDQ can be removed simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-down.

TRUTH TABLE

K	\overline{G}	B1	B2	B3	DQ	Operation
L	X	X	X	X	Hi-Z	Clock Stop
↑	X	H	L	X	Hi-Z	No Operation, Pipeline High-Z
↑	L	L	H	H	DOUT	Load Address, Single Read
↑	L	L	H	L	DOUT	Load Address, Double Read
↑	X	L	L	H	DIN	Load Address, Single Write
↑	X	L	L	L	DIN	Load Address, Double Write
↑	X	H	H	X	B	Increment Address, Continue

NOTE : - B(Both) is DIN in write cycle and DOUT in read cycle. Byte write function is not supported. X means "Don't Care".
- K & \overline{K} are complementary.

BURST SEQUENCE TABLE

4 Burst Operation for Interleaved Burst ($\overline{LBO} = V_{DDQ}$)

Interleaved Burst	Case 1		Case 2		Case 3		Case 4	
	A1	A0	A1	A0	A1	A0	A1	A0
First Address	0	0	0	1	1	0	1	1
↓	0	1	0	0	1	1	1	0
↓	1	0	1	1	0	0	0	1
Fourth Address	1	1	1	0	0	1	0	0

NOTE : - For Interleave Burst $\overline{LBO} = V_{DDQ}$ is recommended. If $\overline{LBO} = V_{DD}$, it must not exceed 2.63V.

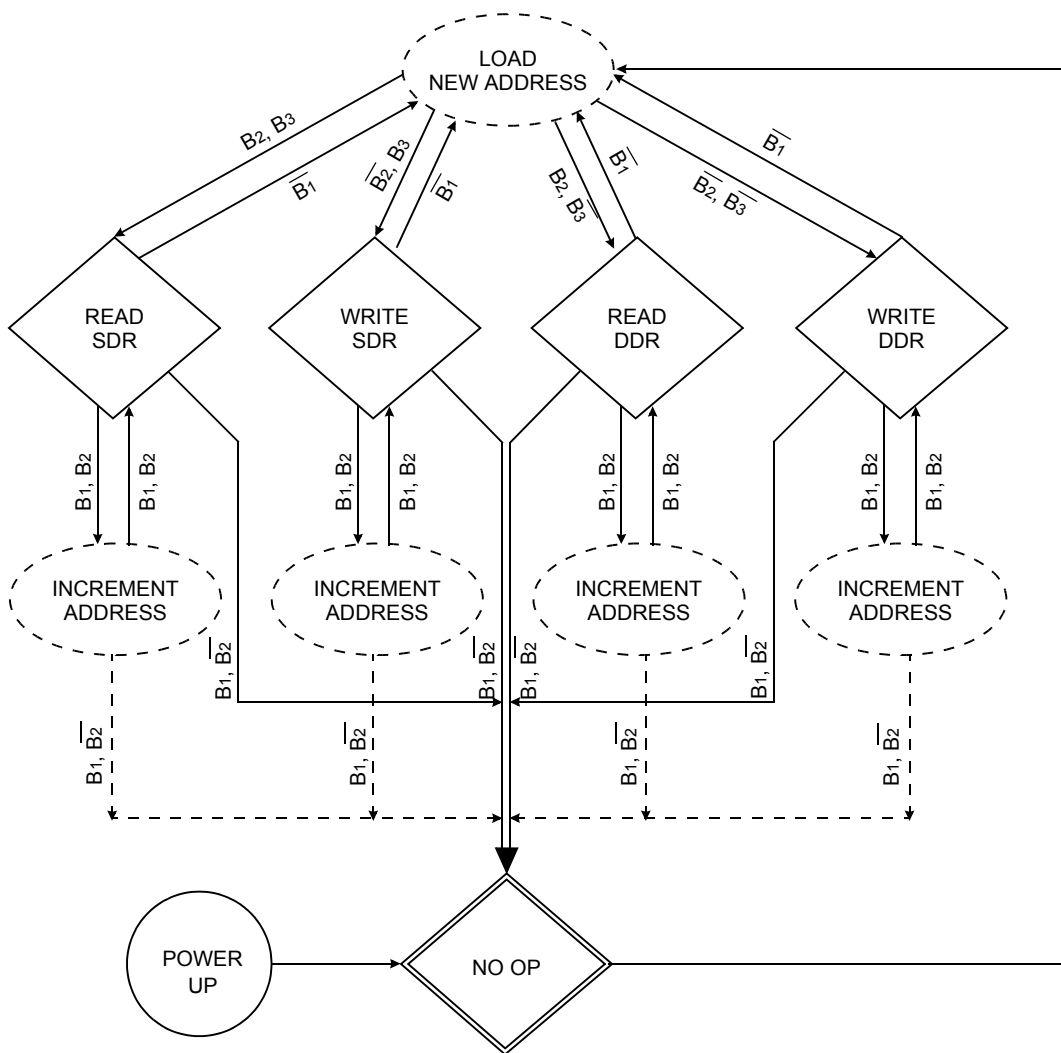

4 Burst Operation for Linear Burst ($\overline{LBO} = V_{SS}$)

Linear Burst Mode	Case 1		Case 2		Case 3		Case 4	
	A1	A0	A1	A0	A1	A0	A1	A0
First Address	0	0	0	1	1	0	1	1
↓	0	1	1	0	1	1	0	0
↓	1	0	1	1	0	0	0	1
Fourth Address	1	1	0	0	0	1	1	0

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Core Supply Voltage Relative to Vss	VDD	-0.5 to 3.13	V
Output Supply Voltage Relative to Vss	VDDQ	-0.5 to 2.3	V
Voltage on any pin Relative to Vss	VIN	-0.5 to VDDQ+0.5 (2.3V MAX)	V
Output Short-Circuit Current(per I/O)	IOUT	25	mA
Storage Temperature	TSTR	-55 to 125	°C

NOTE : Power Dissipation Capability will be dependent upon package characteristics and use environment. See enclosed thermal impedance data. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED DC OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Unit	Note
Core Power Supply Voltage	VDD	1.7	2.5	2.63	V	
Output Power Supply Voltage	VDDQ	1.4	1.5	1.9	V	
Input High Level Voltage	VIH	VREF+0.1	-	VDDQ+0.3	V	1, 2
Input Low Level Voltage	VIL	-0.3	-	VREF-0.1	V	1, 3
Input Reference Voltage	VREF	0.68	0.75	0.95	V	
Clock Input Signal Voltage	VIN-CLK	-0.3	-	VDDQ+0.3	V	1, 4
Clock Input Differential Voltage	VDIF-CLK	0.1	-	VDDQ+0.6	V	1, 5
Clock Input Common Mode Voltage	VCM-CLK	0.68	0.75	0.9	V	1, 6

NOTE :1. These are DC test criteria. DC design criteria is VREF±50mV. The AC VIH/VIL levels are defined separately for measuring timing parameters.

2. VIH (Max)DC=VDDQ+0.3, VIH (Max)AC=2.6V (2.1V for DQs) (pulse width ≤ 20% of cycle time).
3. VIL (Min)DC=-0.3V, VIL (Min)AC=-1.0V (-0.5V for DQs) (pulse width ≤ 20% of cycle time).
4. VIN-CLK specifies the maximum allowable DC level for the differential clock. i.e VIL-CLK and VIH-CLK.
5. VDIF-CLK specifies the minimum Clock differential voltage required for switching. i.e DC voltage difference between VIL-CLK and VIH-CLK.
6. VCM-CLK specifies the Clock crossing point for the differential clock or the allowable common clock level for a single ended clock.

DC CHARACTERISTICS

Parameter	Symbol	Min	Max	Unit	Note
Average Power Supply Operating Current(x36) (Cycle time = tKHKH min)	IDD37		540	mA	1,2
	IDD33		490		
	IDD30	-	440		
	IDD27		420		
Average Power Supply Operating Current(x18) (Cycle time = tKHKH min)	IDD37		510	mA	1,2
	IDD33		460		
	IDD30	-	410		
	IDD27		390		
Stop Clock Standby Current (VIN=VDD-0.2V or 0.2V fixed, K=Low, \bar{K} =High)	ISB1	-	150	mA	1
Input Leakage Current (VIN=Vss or VDDQ)	ILI	-1	1	μA	
Output Leakage Current (VOUT=Vss or VDDQ)	ILO	-1	1	μA	
Output High Voltage(Programmable Impedance Mode)	VOH1	VDDQ/2	VDDQ	V	3
Output Low Voltage(Programmable Impedance Mode)	VOL1	Vss	VDDQ/2	V	4
Output High Voltage(IoH=-0.1mA)	VOH2	VDDQ-0.2	VDDQ	V	5
Output Low Voltage(IoL=0.1mA)	VOL2	Vss	0.2	V	5

NOTE :1. Minimum cycle. IOUT=0mA.

2. 50% read cycles.
3. $|I_{OH}| = (V_{DDQ}/2)/(R_Q/5) \pm 15\%$ @ $V_{OH} = V_{DDQ}/2$ for $175\Omega \leq R_Q \leq 350\Omega$.
4. $|I_{OL}| = (V_{DDQ}/2)/(R_Q/5) \pm 15\%$ @ $V_{OL} = V_{DDQ}/2$ for $175\Omega \leq R_Q \leq 350\Omega$.
5. Minimum Impedance Mode when ZQ pin is connected to Vss.

512Kx36 & 1Mx18 SRAM

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

The SRAM provides a limited set of IEEE standard 1149.1 JTAG functions. This is to test the connectivity during manufacturing between SRAM, printed circuit board and other components. Internal data is not driven out of SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to Vss to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and therefore can be left unconnected. But they may also be tied to VDD through a resistor. TDO should be left unconnected.

JTAG Block Diagram

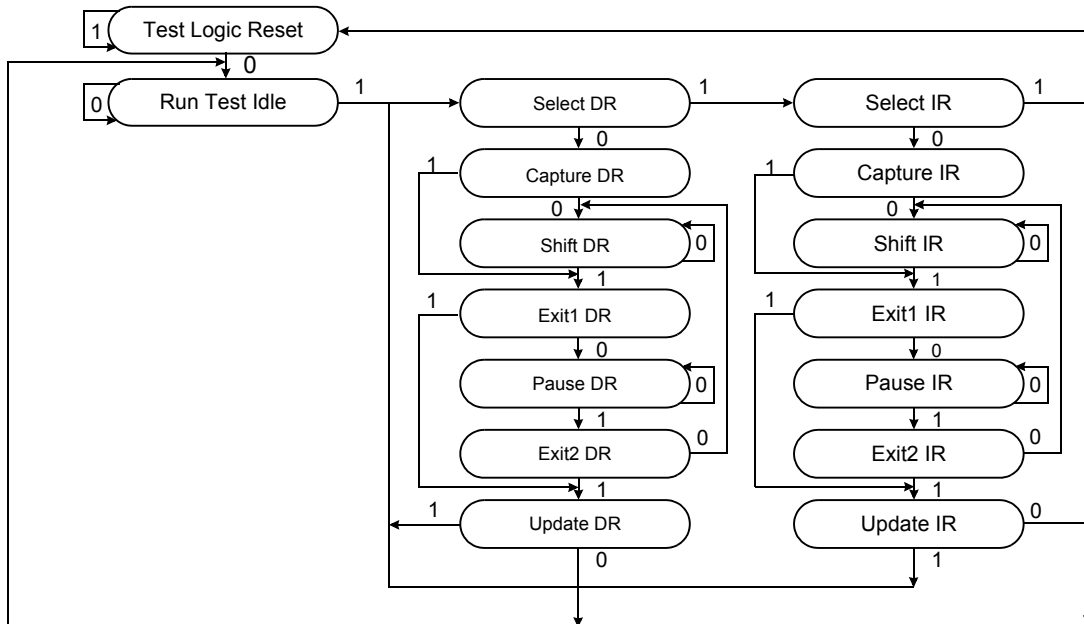

JTAG Instruction Coding

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	RESERVED	Do Not Use	6
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	RESERVED	Do Not Use	6
1	1	1	BYPASS	Bypass Register	4

NOTE :

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to Vss when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.

512Kx36 & 1Mx18 SRAM

JTAG DC OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Unit	Note
Power Supply Voltage	V _{DD}	1.7	2.5	2.6	V	
Input High Level	V _{IH}	0.7*V _{DD}	-	V _{DD} +0.3	V	
Input Low Level	V _{IL}	-0.3	-	0.3*V _{DD}	V	
Output High Voltage(I _{OH} =-2mA)	V _{OH}	0.75*V _{DD}	-	V _{DD}	V	
Output Low Voltage(I _{OL} =2mA)	V _{OL}	V _{SS}	-	0.25*V _{DD}	V	

NOTE : 1. The input level of SRAM pin is to follow the SRAM DC specification.

JTAG AC TEST CONDITIONS

Parameter	Symbol	Min	Unit	Note
Input High/Low Level	V _{IH} /V _{IL}	V _{DD} /0.0	V	
Input Rise/Fall Time	TR/TF	1.0/1.0	ns	
Input and Output Timing Reference Level		V _{DD} /2	V	1

NOTE : 1. See SRAM AC test output load on page 5.

JTAG AC Characteristics

Parameter	Symbol	Min	Max	Unit	Note
TCK Cycle Time	t _{CHCH}	50	-	ns	
TCK High Pulse Width	t _{CHCL}	20	-	ns	
TCK Low Pulse Width	t _{CLCH}	20	-	ns	
TMS Input Setup Time	t _{MVCH}	5	-	ns	
TMS Input Hold Time	t _{CHMX}	5	-	ns	
TDI Input Setup Time	t _{DVCH}	5	-	ns	
TDI Input Hold Time	t _{CHDX}	5	-	ns	
Clock Low to Output Valid	t _{CLQV}	0	10	ns

153 BGA PACKAGE DIMENSIONS

- NOTE :**
1. All Dimensions are in Millimeters.
 2. Solder Ball to PCS Offset : 0.10 MAX.
 3. PCB to Cavity Offset : 0.10 MAX.

153 BGA PACKAGE THERMAL CHARACTERISTICS

Parameter	Symbol	Thermal Resistance	Unit	Note
Junction to Ambient(at still air)	Theta_JA	TBD	°C/W	
Junction to Case	Theta_JC	TBD	°C/W	
Junction to Board	Theta_JB	TBD	°C/W	

NOTE : 1. Junction temperature can be calculated by : $T_J = T_A + P_D \times \text{Theta_JA}$.
