

**Over-Voltage Protection Switch with OCP and BOVP**

**General Description**

The AAT4685 OVPSwitch™ is a member of Skyworks' Application Specific Power MOSFET™ (ASPM™) product family. It is an N-channel MOSFET power switch with precise over-voltage protection control, designed to protect low-voltage systems against high-voltage faults up to +28V. It also integrates over-current protection (OCP), battery over-voltage protection (BOVP) and over-temperature protection (OTP).

When the input voltage exceeds the programmed over-voltage threshold, the N-channel MOSFET switch will be turned off to prevent damage to the output load circuits. An external resistor divider is adopted to program the adjustable version over-voltage trip point. Over-current protection protects the case of output short circuits by disconnecting the load from the input supply.

A battery voltage monitor is integrated and disconnect the IN and OUT when the battery voltage exceed its rated voltage. The AAT4685 also monitors its own die temperature and OVP switch off if it becomes too hot.

The AAT4685 includes an under-voltage lockout (UVLO) protection circuit, which puts the device into sleep mode at low input voltages only consuming 100µA current. It also includes two indicators: input supply power good indicator (POK) which is always active whether EN is low or high, and a fault flag indicator (FLT) which goes to active low when a fault condition (OV, OC, BOV and OT) occurs at EN = low.

The AAT4685 is offered in a Pb-free, 3x3mm 12-pin TDFN package with a pin-out optimized for safety and is specified for operation over the -40°C to +85°C ambient temperature range.

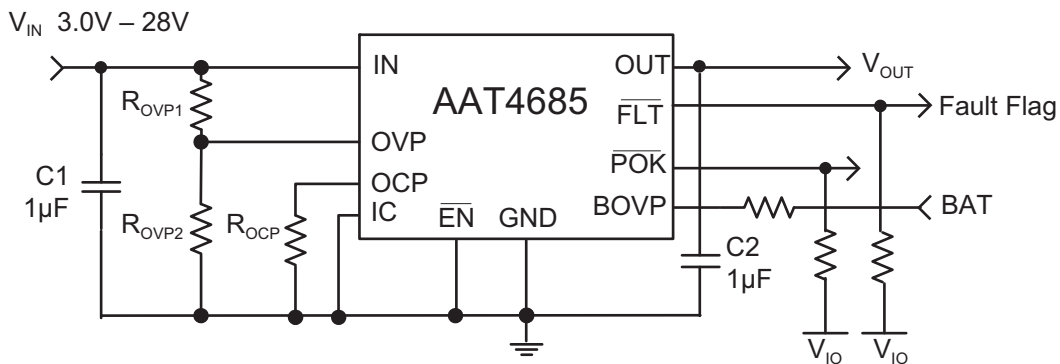

**Features**

- $V_{IN}$  Range: 3.0V – 28V
- OVP Threshold Setting Range: 4V – 7V
  - Fixed: 5.85V and 6.8V
  - Adjustable
- Fast OVP Response: 1µs (max) Response to Over-Voltage Transient
- OVP Recovery Delay Time: 8ms
- Over-Current Protection
  - Adjustable 0.3 – 1.8A
- Battery OVP 4.35V
- Thermal Shutdown Protection
- Low Quiescent Current
  - 600µA Typical
  - 100µA Typical Standby Current
- Under-Voltage Lockout
- 120mΩ Typical  $R_{DS(ON)}$  at 5.0V
- Active Low Enable with Internal 200kΩ Pull-Down Resistor
- Input Supply Power Good Indicator, Open Drain
- OVP/OCP/BOVP/OT Fault Indicator, Open Drain
- Temperature Range: -40°C to 85°C
- 3x3mm TDFN-12 Package

**Applications**

- Cell Phones
- Digital Still Cameras
- MP3
- Personal Data Assistants (PDAs)

**Typical Application**

# AAT4685

## Over-Voltage Protection Switch with OCP and BOVP

### Pin Descriptions

Pin #	Symbol	Function
1	OCP	Over-current protection threshold input. Connect resistor to ground to set OCP limit.
2	IC	Internally connected. Connect this pin to ground.
3	$\overline{EN}$	Active low enable with internal 200k $\Omega$ resistor pull down to GND
4	$\overline{POK}$	Input supply power-good status pin, open-drain. The $\overline{POK}$ function is always active whether $\overline{EN}$ is low or high. Connect a 1k $\Omega$ to 100k $\Omega$ pull-up resistor to the logic I/O voltage of the host system.
5,6	OUT	Output. Connect a 0.1 $\mu$ F~47 $\mu$ F capacitor from OUT to GND.
7,8	IN	Power input pin. Connect 1 $\mu$ F capacitor from IN to GND.
9	GND	Ground connection.
10	$\overline{FLT}$	Open-drain output. Active low when input over-voltage, input over-current, battery over-voltage, or over temperature and EN = low. The $\overline{FLT}$ pin goes to high impedance state when EN = high. Connect a 1k $\Omega$ to 100k $\Omega$ pull-up resistor to the logic I/O voltage of the host system.
11	BOVP	Battery voltage sense input. Connect to battery positive terminal through a 100k $\Omega$ resistor to limit the current in case of a short circuit condition.
12	OVP (N/C)	Over-voltage protection threshold input (Adjustable only). Fixed version not connected.

**Functional Block Diagram****Functional Description**

The AAT4685 provides up to 28V over-voltage and over-current protection when powering low-voltage systems such as cell phones, MP3, and PDAs or when charging Lithium Ion batteries from a badly regulated supply. The AAT4685 is inserted between the power supply or charger source and the load to be protected. The AAT4685 IC consists of a low resistance OVP switch, under-voltage lockout protection, over-voltage monitor and protection, over-current protection, battery over-voltage protection, fast shut-down circuitry and a fault output flag.

In normal operation the OVP switch acts as a slew-rate controlled load switch, connecting and disconnecting the power supply from IN to OUT. A low resistance N channel MOSFET is used as to minimize the voltage drop between the voltage source and the load and to reduce the power dissipation.

When the voltage on the input exceeds the programmed over-voltage trip point, the device immediately turns off

the internal OVP switch disconnecting the load from the abnormal voltage, preventing damage to any downstream components. In the case of an over current condition, it limits the system current at the threshold value, and if the over current persists, the OVP switch is turned off after a blanking period. If the battery voltage rises to an unsafe level (BOVP threshold), the IC disconnects OUT from the charging input power IN until the battery voltage returns to an acceptable value. BOVP or OCP blanking time ignores short time transients of over-battery voltage and overload current. Additionally, AAT4685 also monitors its own die temperature and turns the OVP switch off if it becomes too hot.

The AAT4685 has a fault flag ( $\overline{\text{FLT}}$ ) pin to indicate the fault conditions of input power over-voltage, load current over-current, battery over-voltage, and over-temperature by pulling the flag signal down to alert the system. If an input over-voltage condition or over-voltage battery condition exists at the time of the device enable, then the OVP switch will remain OFF and  $\overline{\text{FLT}}$  is always low.

**Over-Voltage Protection Switch with OCP and BOVP****Under-Voltage Lockout (UVLO)**

The AAT4685 has a fixed 2.7V under-voltage lockout level (UVLO) trip level for IN rising. When the input voltage is less than  $2.7V - V_{UVLO\_HYS}$ , the OVP switch is turned off. 100mV of hysteresis is included to ensure circuit stability.

**Over-Voltage Protection (OVP)**

The AAT4685 adjustable version has a  $1.0V \pm 3\%$  over-voltage trip threshold on the OVP pin. With a resistor divider on OVP pin from IN to GND, the over-voltage protection point of IN can be adjusted between 4V and 7V. If the over-voltage trip level is triggered, the OVP switch will start to be turned off in 1 $\mu$ s. The  $\overline{FLT}$  pin is driven low. When the input voltage pin returns below  $V_{OVPT} - V_{OVP\_HYS}$  (but is still above  $V_{UVLO}$ ), the OVP switch is turned on again after a  $T_{OVP\_REC}$  recovery time to ensure that the input supply has stabilized.

Fixed OVP products are also available where the resistive divider is internally integrated. Pin 12 is designed to be not connected.

**Over-Current Protection (OCP)**

The AAT4685 integrates adjustable over-current protection. Once the load current exceeds the pre-set limit of  $I_{OCP}$  current ( $I_{LOAD} > I_{OCP}$ ), the load current is limited after the OCP blanking time (typical 180 $\mu$ s). During the OCP blanking time, the OVP switch stays ON. Once the load current drops below  $I_{OCP}$ , current restriction will be removed. If the over-current state continues after the blanking period, the OVP switch turns off and  $\overline{FLT}$  is pulled down. In order to prevent the input voltage from spiking up due to the inductance of the input cable, the OVP switch is turned off slowly, resulting in a "soft-stop." The OVP switch will turn back on again after  $T_{OCP\_REC}$  (typical 64ms) and the current is monitored all over again. Each time an OCP fault occurs, an internal counter is incremented. If 15 OCP faults occur in one charge cycle, the OVP switch is turned off permanently. The counter is cleared either by removing and re-applying input power, or by disabling and re-enabling the device via the  $\overline{EN}$  pin.

The OCP threshold is set by an external resistor ( $R_{OCP}$ ) connected between OCP and ground.  $I_{OCP}$  is approximated by the following formula:

$$I_{OCP} = \frac{30}{R_{OCP}} \quad (\text{current in A, resistance in k}\Omega)$$

**Battery Over-Voltage Protection (BOVP)**

The AAT4685 monitors the positive battery terminal and turns the OVP switch off when the battery voltage exceeds the BOVP threshold (typical 4.35V). The monitor has blanking time  $T_{BOVP\_BL}$  (typical 180 $\mu$ s) to prevent any transient voltage from false triggering the BOVP. A resistor is required between the BOVP pin and the battery, to limit the current in case of a short circuit condition. If the battery voltage exceeds the BOVP trip threshold  $V_{BOVPT}$ , the OVP switch is turned off, and the  $\overline{FLT}$  pin is driven low. In order to prevent the input voltage from spiking up due to the inductance of the input cable, the OVP switch is turned off slowly, resulting in a "soft-stop." The OVP switch is turned back on once the battery voltage drops to  $V_{BOVPT} - V_{BOVP\_HYS}$ . Each time a battery over-voltage fault occurs, an internal counter is incremented. If 15 such faults occur in one charge cycle, the OVP switch is turned off permanently. The counter is cleared either by removing and re-applying input power, or by disabling and re-enabling the device via the  $\overline{EN}$  pin.

**Over-Temperature Protection (OT Protection)**

If the junction temperature of the device exceeds  $T_{SHDN}$ , the OVP switch is turned off, and the  $\overline{FLT}$  pin is driven low. The OVP switch is turned back on when the junction temperature falls below  $T_{SHDN} - 15^{\circ}\text{C}$ .

**Fault Indicator ( $\overline{FLT}$ )**

The  $\overline{FLT}$  output is an active-low open-drain fault (OV/OC/BOVP/OT) reporting output. A pull-up resistor should be connected from  $\overline{FLT}$  to the logic I/O voltage of the host system. When  $\overline{EN}$  is low,  $\overline{FLT}$  is asserted by pulling down in the case of an over-voltage, over-current, or battery over-voltage or over-temperature fault occurring;  $\overline{FLT}$  is de-asserted into high impedance state with the fault removed. When  $\overline{EN}$  is high,  $\overline{FLT}$  is in high impedance status.

**Over-Voltage Protection Switch with OCP and BOVP****Enable Control ( $\overline{\text{EN}}$ )**

$\overline{\text{EN}}$  is an active low enable with internal 200k $\Omega$  resistor pulled down to GND.  $\overline{\text{EN}}$  is driven low, connected to ground, or left floating for normal device operation. Set  $\overline{\text{EN}}$  low to turn the OVP switch on after turn on delay time. Set  $\overline{\text{EN}}$  high to turn the OVP switch off. In the case of an over-voltage or UVLO condition toggling  $\overline{\text{EN}}$  will not override the fault condition and the OVP switch will remain off. The OCP counter and the BOVP counter are both reset when the device is re-enabled by the  $\overline{\text{EN}}$  pin.

**IC Input**

Internally connected to GND through a 100k $\Omega$  resistor. Connect this pin to ground.

**Power-OK Indicator ( $\overline{\text{POK}}$ )**

The AAT4685 contains an open-drain  $\overline{\text{POK}}$  output that goes low when a valid input source is detected at the IN pin. The valid input range is between  $V_{\text{UVLO}}$  (typical 2.7V) and  $V_{\text{OVP}}$  voltage (fixed 5.85V / fixed 6.8V / adjustable OVP threshold set by external resistors). After a valid input has been established, charging is sustained. The  $\overline{\text{POK}}$  function is always active whether the  $\overline{\text{EN}}$  pin is at low or high state.

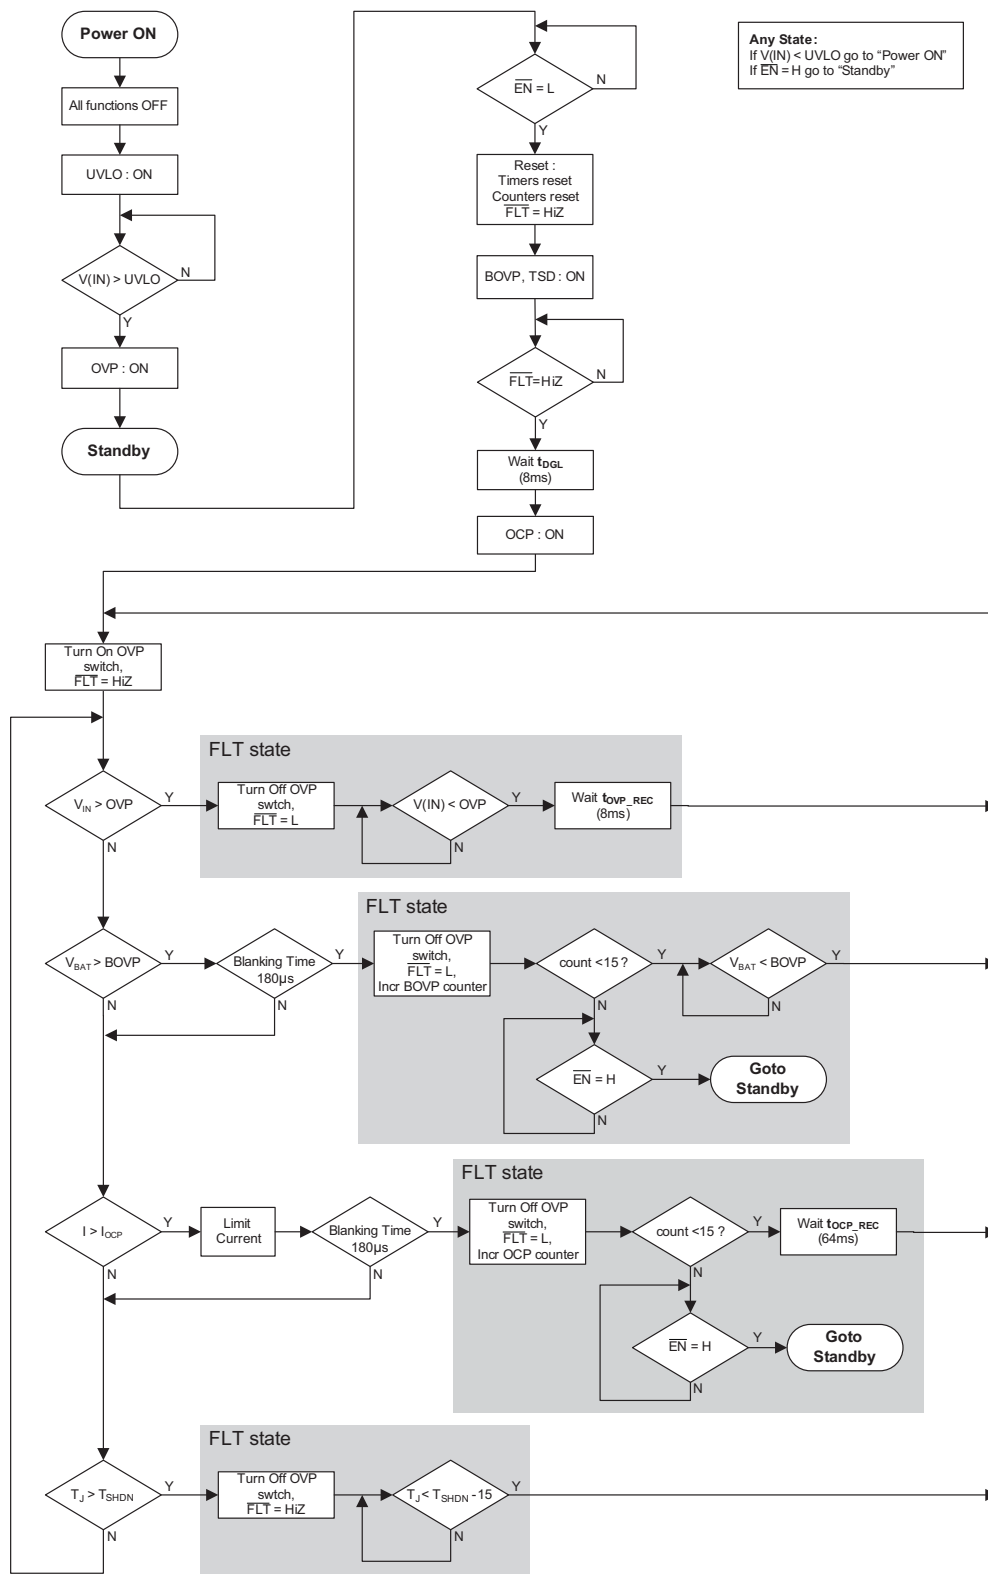

**Device Start-Up Operation**

On initial power-up, if  $V_{\text{UVLO}} < \text{IN} < V_{\text{OVP}}$ ,  $V_{\text{BAT}} < V_{\text{BOVP}}$ , and  $\overline{\text{EN}}$  is low, the OVP switch starts to turn on after  $T_{\text{ON}}$  delay time (typical 8ms) to be stabilized for input. This turn on uses Soft Start to control the inrush current to minimize ringing at the input. Because of the deglitch time at power on, if the input voltage rises rapidly past the OVP threshold, the device does not switch on at all; instead it goes into protection mode and indicate a fault on the  $\overline{\text{FLT}}$  pin. After successful start-up, if  $I_{\text{LOAD}} > I_{\text{OCP}}$  limit the device turns off and the fault flag is asserted.

The Soft Start function is defined as follows: "current limit is stepped digitally from low level to its final current limit level for soft starting."

## Over-Voltage Protection Switch with OCP and BOVP

### System Flowchart

## Over-Voltage Protection Switch with OCP and BOVP

### Application Information

#### Over-Voltage Protection Resistors

The over-voltage protection threshold is programmed with two resistors, R1 and R2. To limit the current going through the external resistor string while maintaining good noise immunity, use smaller resistor values, such as 10kΩ for R2. Using a larger value will further reduce the system current, but will also increase the impedance of the OVP node, making it more sensitive to external noise and interference. A suggested value for R2 is 100kΩ. R1 can be calculated using the following equation:

$$R_1 = \left( \frac{V_{OVP}}{V_{OVP\_TH}} - 1 \right) \cdot R_2 = (V_{OVP} - 1) \cdot 100$$

Table 1 summarizes 1% standard metal film resistors for several over-voltage settings.

R2 (kΩ)	R1 (kΩ)	V <sub>OVP</sub> Setting (V)
100	300	4.0
100	348	4.5
100	402	5.0
100	442	5.5
100	499	6.0
100	549	6.5
100	604	7.0

**Table 1: 1% Standard Resistor Values for OVP Setting.**

#### Over-Current Protection Resistor

The over-current threshold is programmed by an external resistor (R<sub>OCP</sub>) connected from the OCP pin to GND. R<sub>OCP</sub> can be calculated by the following equation.

$$R_{OCP} = \frac{30}{I_{OCP}} \cdot 1000$$

Table 2 summarizes 1% standard metal film resistors for several over-current settings.

R3 (kΩ)	I <sub>OCP</sub> Setting (A)
100.0	0.30
86.6	0.35
75.0	0.40
66.5	0.45
60.4	0.50
54.9	0.55
49.9	0.60
43.0	0.70
37.4	0.80
33.2	0.90
30.1	1.00
24.9	1.20
21.5	1.40
18.7	1.60
16.5	1.80

**Table 2: 1% Standard Resistor Values for OCP Setting.**

#### Input Capacitor

A 1μF or larger capacitor is typically recommended for C<sub>IN</sub>. C<sub>IN</sub> should be located as close to the device IN pin as practically possible. Ceramic, tantalum, or aluminum electrolytic capacitors may be selected for C<sub>IN</sub>. There is no specific capacitor equivalent series resistance (ESR) requirement for C<sub>IN</sub>. However, for higher current operation, ceramic capacitors are recommended for C<sub>IN</sub> due to their inherent capability over tantalum capacitors to withstand input current surges from low impedance sources such as batteries in portable devices.

Capacitors are typically manufactured in different voltage ratings. If the maximum possible surge voltage is known, select capacitors with a voltage rating at least 5V higher than the maximum possible surge voltage. 50V rated capacitors are generally good for most OVP applications to prevent any surge voltage.

## Over-Voltage Protection Switch with OCP and BOVP

### Output Capacitor

In order to insure stability while current limit is active, a small output capacitance of approximately  $1\mu\text{F}$  is required at the output. Likewise, with the output capacitor, there is no specific capacitor ESR requirement. If desired,  $C_{\text{OUT}}$  may be increased to accommodate any load transient condition.

### PCB Layout Recommendations

For proper thermal management and to take advantage of the low  $R_{\text{DS(ON)}}$  of the AAT4685, certain circuit board layout rules should be followed:

1.  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  should be routed using wider than normal traces.
2. GND should be connected to a ground plane. The ground plane area connected to the ground pins should be made as large as possible. Exposed pad should be connected to ground plane to get best power dissipation.
3. For best performance,  $C_{\text{IN}}$  and  $C_{\text{OUT}}$  should be placed close to the IN and OUT pins.

SQ04-0074.

### Packaging Information

#### TDFN33-12

All dimensions in millimeters.

1. XYY = assembly and date code.  
 2. Sample stock is generally held on part numbers listed in **BOLD**.  
 3. The leadless package family, which includes QFN, TQFN, DFN, TDFN and STDFN, has exposed copper (unplated) at the end of the lead terminals due to the manufacturing process. A solder fillet at the exposed copper edge cannot be guaranteed and is not required to ensure a proper bottom solder connection.

**Over-Voltage Protection Switch with OCP and BOVP**

Information in this document is provided in connection with Skyworks Solutions, Inc. ("Skyworks") products or services. These materials, including the information contained herein, are provided by Skyworks as a service to its customers and may be used for informational purposes only by the customer. Skyworks assumes no responsibility for errors or omissions in these materials or the information contained herein. Skyworks may change its documentation, products, services, specifications or product descriptions at any time, without notice. Skyworks makes no commitment to update the materials or information and shall have no responsibility whatsoever for conflicts, incompatibilities, or other difficulties arising from any future changes.

No license, whether express, implied, by estoppel or otherwise, is granted to any intellectual property rights by this document. Skyworks assumes no liability for any materials, products or information provided hereunder, including the sale, distribution, reproduction or use of Skyworks products, information or materials, except as may be provided in Skyworks Terms and Conditions of Sale.

THE MATERIALS, PRODUCTS AND INFORMATION ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE, INCLUDING FITNESS FOR A PARTICULAR PURPOSE OR USE, MERCHANTABILITY, PERFORMANCE, QUALITY OR NON-INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHT; ALL SUCH WARRANTIES ARE HEREBY EXPRESSLY DISCLAIMED. SKYWORKS DOES NOT WARRANT THE ACCURACY OR COMPLETENESS OF THE INFORMATION, TEXT, GRAPHICS OR OTHER ITEMS CONTAINED WITHIN THESE MATERIALS. SKYWORKS SHALL NOT BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO ANY SPECIAL, INDIRECT, INCIDENTAL, STATUTORY, OR CONSEQUENTIAL DAMAGES, INCLUDING WITHOUT LIMITATION, LOST REVENUES OR LOST PROFITS THAT MAY RESULT FROM THE USE OF THE MATERIALS OR INFORMATION, WHETHER OR NOT THE RECIPIENT OF MATERIALS HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Skyworks products are not intended for use in medical, lifesaving or life-sustaining applications, or other equipment in which the failure of the Skyworks products could lead to personal injury, death, physical or environmental damage. Skyworks customers using or selling Skyworks products for use in such applications do so at their own risk and agree to fully indemnify Skyworks for any damages resulting from such improper use or sale.

Customers are responsible for their products and applications using Skyworks products, which may deviate from published specifications as a result of design defects, errors, or operation of products outside of published parameters or design specifications. Customers should include design and operating safeguards to minimize these and other risks. Skyworks assumes no liability for applications assistance, customer product design, or damage to any equipment resulting from the use of Skyworks products outside of stated published specifications or parameters.
