## DESCRIPTION

The 74 HCT 652 is an advanced high-speed CMOS OCTAL BUS TRANSCEIVER AND REGISTER (3-STATE) fabricated with silicon gate $\mathrm{C}^{2}$ MOS technology.
This device consists of bus transceiver circuits, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or from the internal storage registers. Enable GAB and $\overline{\mathrm{GBA}}$ are provided to control the transceiver functions. Select $\mathrm{AB}(\mathrm{SAB})$ and select $B A(S B A)$ control pins are provided to select whether real-time or stored data is transferred. A low input level selects real-time data, and a high selects stored data.
Data on the A or B bus, or both, can be stored in the internal D flip-flops by low-to-high transition at the appropriate clock pins (CLOCK AB or CLOCK

BA) regardless of the select or enable control pins. When select $A B$ and select $B A$ are in the real time transfer mode, it is also possible to store data without using the internal $D$ type flip-flops by simultaneously enabling GAB and GBA. In this configuration each output reinforces its input. Thus, when all other data sources to the two sets of bus lines are at high impedance, each set of bus lines will remain at its last state.
All inputs are equipped with protection circuits against static discharge and transient excess voltage.
