

ST715XX ST715XX25, ST715XX33

High input voltage - 85 mA LDO linear regulator

Features

- 2.5 V to 24 V input voltage
- Low dropout voltage (500 mV typ. at 85 mA)
- Very low quiescent current (3.8 μ A typ. at full load)
- 85 mA guaranteed output current
- Output voltage: fixed or adjustable
- Compatible with ceramic output capacitors from 0.47 μ F to 10 μ F
- Internal current limit
- Package DFN8 (3 x 3 mm), SOT23-5L
- Temperature range: -40 °C to 125 °C

Applications

- Mobile phones
- Personal digital assistant (PDAs)
- Cordless phones and similar battery powered systems

Description

The ST715xx is a high voltage, ultra low quiescent low drop linear regulator capable of providing an output current in excess of 85 mA.

The device operates over an input voltage range spanning from 2.5 V to 24 V, and is also stable with output ceramic capacitors. Fault condition protection includes short-circuit current limitation. The ultra low quiescent current of 3.8 μ A at full load makes it highly suitable for low power applications and battery powered systems. The wide input voltage range makes the ST715xx an ideal solution for low power industrial applications also. The ST715xx is available in the DFN8 (3 x 3 mm) 8 leads or the SOT23-5.

Table 1. Device summary

Order codes				Output voltage
SOT23-5L	Marking	DFN8 (3 x 3 mm)	Marking	
ST715MR	71AD	ST715PUR	715AD	ADJ

I_Q	Quiescent current	$I_{OUT} = 0\text{ mA}$ to 85 mA , $T_J = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$			3.75	5.5	μA
			$V_{IN} = 24\text{ V}$		4.15	6.5	
I_{SC}	Short circuit current	$V_{OUT} = 0$, $T_J = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$ $V_{IN} = 3.8\text{ V}$	120			mA	
T_{ON}	Turn on time ⁽⁴⁾	$V_{IN} = 4.2\text{ V}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $I_{OUT} = 60\text{ mA}$, $T_J = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$		0.7		ms	
C_{OUT}	Output capacitor	Capacitance f = 100kHz	0.47			μF	

1. For $V_{OUT(NOM)} < 2\text{ V}$, $V_{IN} = 2.5\text{ V}$.

2. Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value. This specification does not apply for output voltages below 2 V.

3. Guaranteed by design.

4. Turn-on time is time measured between the input just exceeding 90 % of its final value and the output voltage just reaching 95% of its nominal value.

5 Output voltage selection for adjustable version

The ST715xx features an adjustable output voltage using two external resistors connected as a voltage divider to the FB pin as shown in the typical application circuit [Figure 4](#). The output voltage is set using the following equation:

Equation 1

$$V_{OUT} = V_{FB} (1 + R_1/R_2)$$

where typically $V_{FB} = 1.2$ V. Choose $R_2 \geq 5$ k Ω in order to optimize quiescent current, accuracy, and high-frequency power-supply rejection. To simplify resistor selection use the following equation:

Equation 2

$$R_1 = R_2 \times (V_{OUT}/V_{FB} - 1)$$

5.1 External capacitor requirements

A 0.1 μ F or larger input bypass capacitor, connected between IN and GND and located close to the device, is recommended to improve transient response and noise rejection of the power supply as a whole. A higher-value input capacitor may be necessary if large, fast-rise-time load transients will be present in the application and if the device is located several inches away from the power source.

The ST715xx requires an output capacitor connected between OUT and GND to stabilize the internal control loop. Any capacitor (including ceramic and tantalum) with a value higher than 0.47 μ F will properly stabilize this loop.

5.2 Power dissipation and junction temperature

To ensure reliable operation, worst-case junction temperature should not exceed 125 °C. This restriction limits the power dissipation the regulator can handle in any given application. To ensure that the junction temperature is within acceptable limits, calculate the maximum allowable dissipation, $P_{D(max)}$, and the actual dissipation, P_D , which must be less than or equal to $P_{D(max)}$.

The maximum power dissipation limit is determined using the following equation:

Equation 3

$$P_{D(max)} = (T_{JMAX} - T_A) / R_{thJA}$$

where:

T_{JMAX} is the maximum allowable junction temperature.

R_{thJA} is the thermal resistance junction-to-ambient for the package.

T_A is the ambient temperature.

The regulator dissipation is calculated using the following equation:

Equation 4

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT}$$

Power dissipation resulting from quiescent current is negligible.

The ST715xx features internal current limiting. During normal operation, it limits output current to approximately 350 mA. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. Take care not to exceed the power dissipation ratings of the package.
