

# STM32F103xC STM32F103xD STM32F103xE

Performance line, ARM-based 32-bit MCU with up to 512 KB Flash,  
USB, CAN, 11 timers, 3 ADCs and 13 communication interfaces

Preliminary Data

## Features

- Core: ARM 32-bit Cortex™-M3 CPU
  - 72 MHz maximum frequency, 1.25 DMIPS/MHz (Dhrystone 2.1) performance at 0 wait state memory access
  - Single-cycle multiplication and hardware division
- Memories
  - 256-to-512 Kbytes of Flash memory
  - up to 64 Kbytes of SRAM
  - Flexible static memory controller with 4 Chip Select. Supports Compact Flash, SRAM, PSRAM, NOR and NAND memories
  - LCD parallel interface, 8080/6800 modes
- Clock, reset and supply management
  - 2.0 to 3.6 V application supply and I/Os
  - POR, PDR, and programmable voltage detector (PVD)
  - 4-to-16 MHz crystal oscillator
  - Internal 8 MHz factory-trimmed RC
  - Internal 40 kHz RC with calibration
  - 32 kHz oscillator for RTC with calibration
- Low power
  - Sleep, Stop and Standby modes
  - $V_{BAT}$  supply for RTC and backup registers
- 3 × 12-bit, 1  $\mu$ s A/D converters (up to 21 channels)
  - Conversion range: 0 to 3.6 V
  - Triple-sample and hold capability
  - Temperature sensor
- 2-channel 12-bit D/A converter
- DMA: 12-channel DMA controller
  - Supported peripherals: timers, ADCs, DAC, SDIO, I<sup>2</sup>Ss, SPIs, I<sup>2</sup>Cs and USARTs
- Debug mode
  - Serial wire debug (SWD) & JTAG interfaces
  - Cortex-M3 Embedded Trace Macrocell™

- Up to 112 fast I/O ports
  - 51/80/112 I/Os, all mappable on 16 external interrupt vectors, all 5 V-tolerant except for analog inputs
- Up to 11 timers
  - Up to four 16-bit timers, each with up to 4 IC/OC/PWM or pulse counter
  - 2 × 16-bit, 6-channel timers with PWM output and dead-time generation
  - 2 × watchdog timers (Independent and Window)
  - SysTick timer: a 24-bit downcounter
  - 2 × 16-bit basic timers to drive the DAC
- Up to 13 communication interfaces
  - Up to 2 × I<sup>2</sup>C interfaces (SMBus/PMBus)
  - Up to 5 USARTs (ISO 7816 interface, LIN, IrDA capability, modem control)
  - Up to 3 SPIs (18 Mbit/s), 2 with I<sup>2</sup>S interface multiplexed
  - CAN interface (2.0B Active)
  - USB 2.0 full speed interface
  - SDIO interface
- CRC calculation unit, 96-bit unique ID
- ECOPACK® packages

## 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F103xC, STM32F103xD and STM32F103xE High-density performance line microcontrollers. For more details on the whole STMicroelectronics STM32F103xx family, please refer to [Section 2.2: Full compatibility throughout the family](#).

The High-density STM32F103xx datasheet should be read in conjunction with the Medium- and High-density STM32F10xxx reference manual.

For information on programming, erasing and protection of the internal Flash memory please refer to the *STM32F10xxx Flash programming manual*.

The reference and Flash programming manuals are both available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the Cortex™-M3 core please refer to the Cortex™-M3 Technical Reference Manual, available from the [www.arm.com](http://www.arm.com) website at the following address: <http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0337e/>.

## 2 Description

The STM32F103xC, STM32F103xD and STM32F103xE performance line family incorporates the high-performance ARM® Cortex™-M3 32-bit RISC core operating at a 72 MHz frequency, high-speed embedded memories (Flash memory up to 512 Kbytes and SRAM up to 64 Kbytes), and an extensive range of enhanced I/Os and peripherals connected to two APE buses. All devices offer three 12-bit ADCs, four general purpose 16-bit timers plus two PWM timer, as well as standard and advanced communication interfaces: up to two I<sup>2</sup>Cs, three SPIs, two I2Ss, one SDIO, five USARTs, an USB and a CAN.

The STM32F103xx High-density performance line family operates in the -40 to +105 °C temperature range, from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F103xx High-density performance line family offers devices in 5 different package types: from 64 pins to 144 pins. Depending on the device chosen, different sets of peripherals are included, the description below gives an overview of the complete range of peripherals proposed in this family.

These features make the STM32F103xx High-density performance line microcontroller family suitable for a wide range of applications:

- Motor drive and application control
- Medical and handheld equipment
- PC peripherals gaming and GPS platforms
- Industrial applications: PLC, inverters, printers, and scanners
- Alarm systems, Video intercom, and HVAC

[Figure 1](#) shows the general block diagram of the device family.

## 2.1 Device overview

**Table 2. STM32F103xC, STM32F103xD and STM32F103xE features and peripheral counts**

Peripherals		STM32F103Rx			STM32F103Vx			STM32F103Zx								
Flash memory in Kbytes		256	384	512	256	384	512	256	384	512						
SRAM in Kbytes		48	64		48	64		48	64							
FSMC		No			Yes			Yes								
Timers	General-purpose	4														
	Advanced-control	2														
	Basic	2														
Comm	SPI(I <sup>2</sup> S) <sup>(1)</sup>	3(2)														
	I <sup>2</sup> C	2														
	USART	5

12-bit DAC		1														
Number of channels		2														
CPU frequency		72 MHz														
Operating voltage		2.0 to 3.6 V														
Operating temperatures		Ambient temperatures: -40 to +85 °C / -40 to +105 °C (see <a href="#">Table 9</a> ) Junction temperature: -40 to + 125 °C (see <a href="#">Table 9</a> )														
Package		LQFP64		LQFP100 <sup>(2)</sup> , BGA100		LQFP144, BGA144										

1. The SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either the SPI mode or the I<sup>2</sup>S audio mode.
2. For the LQFP100 and BGA100 packages, only FSMC Bank1 and Bank2 are available. Bank1 can only support a multiplexed NOR Flash memory using the NCE1 Chip Select. Bank2 can only support a 16- or 8-bit NAND Flash memory using the NCE2 Chip Select. The interrupt line cannot be used since Port G is not available in this package.

## 2.2 Full compatibility throughout the family

The STM32F103xx is a complete family whose members are fully pin-to-pin, software and feature compatible. In the reference manual, the STM32F103x6, STM32F103x8 and STM32F103xB are referred to as Medium-density devices, while the STM32F103xC, STM32F103xD and STM32F103xE are referred to as High-density devices. High-density devices are an extension of the Medium-density STM32F103x6/8/B/C devices specified in the STM32F103xx datasheet.

High-density STM32F103xx devices feature higher Flash memory and RAM capacities, and additional peripherals like SDIO, FSMC, I<sup>2</sup>S and DAC, while remaining fully compatible with the other members of the family.

The STM32F103xC, STM32F103xD and STM32F103xE are a drop-in replacement for the STM32F103x6/8/A/B/C devices, allowing the user to try different memory densities and providing a greater degree of freedom during the development cycle.

**Table 3. STM32F103xx family**

Pinout	Memory size					
	Medium-density STM32F103xx devices			High-density STM32F103xx devices		
	32 KB Flash	64 KB Flash	128 KB Flash	256 KB Flash	384 KB Flash	512 KB Flash
	10 KB RAM	20 KB RAM	20 KB RAM	48 KB RAM	64 KB RAM	64 KB RAM
144				5 × USARTs		
100	3 × USARTs			4 × 16-bit timers, 2 × basic timers		
64	2 × USARTs 2 × 16-bit timers 1 × SPI, 1 × I <sup>2</sup> C, USB, CAN, 1 × PWM timer	3 × 16-bit timers	2 × SPIs, 2 × I <sup>2</sup> Cs, USB, CAN, 1 × PWM timer	3 × SPIs, 2 × I <sup>2</sup> Ss, 2 × I <sup>2</sup> Cs USB, CAN, 2 × PWM timers 3 × ADCs, 1 × DAC, 1 × SDIO FSMC (100- and 144-pin packages <sup>(1)</sup> )		
48		1 × ADC				
36	1 × ADC					

1. Ports F and G are not available in devices delivered in 100-pin packages.

## 2.3 Overview

### ARM® Cortex™-M3 core with embedded Flash and SRAM

The ARM Cortex™-M3 processor is the latest generation of ARM processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM Cortex™-M3 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

With its embedded ARM core, STM32F103xC, STM32F103xD and STM32F103xE performance line family is compatible with all ARM tools and software.

*Figure 1* shows the general block diagram of the device family.

**Embedded Flash memory**

Up to 512 Kbytes of embedded Flash is available for storing programs and data.

**CRC (cyclic redundancy check) calculation unit**

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

**Embedded SRAM**

Up to 64 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states.

**FSMC (flexible static memory controller)**

The FSMC is embedded in the STM32F103xC, STM32F103xD and STM32F103xE performance line family. It has four Chip Select outputs supporting the following modes: RAM, PSRAM, NOR and NAND.

Functionality overview:

- The three FSMC interrupt lines are ORed in order to be connected to the NVIC
- Write FIFO
- Code execution from external memory except for
- The targeted frequency is SYSCLK/2, so external access is at 30 MHz when the system is at 72 MHz and external access is at 24 MHz when the system is at 48 MHz

**LCD parallel interface**

The FSMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build cost-effective graphic applications using LCD modules with embedded controllers or high-performance solutions using external controllers with dedicated acceleration.

### Nested vectored interrupt controller (NVIC)

The STM32F103xC, STM32F103xD and STM32F103xE performance line embeds a nested vectored interrupt controller able to handle up to 60 maskable interrupt channels (not including the 16 interrupt lines of Cortex™-M3) and 16 priority levels.

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of *late arriving* higher priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

### External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 19 edge detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 112 GPIOs can be connected to the 16 external interrupt lines.

### Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-16 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

Several prescalers allow the configuration of the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz. The maximum allowed frequency of the low speed APB domain is 36 MHz. See [Figure 2](#) for details on the clock tree.

### Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from User Flash
- Boot from System Memory
- Boot from embedded SRAM

The boot loader is located in System Memory. It is used to reprogram the Flash memory by using USART1.

### Power supply schemes

- $V_{DD} = 2.0$  to  $3.6$  V: external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SSA}, V_{DDA} = 2.0$  to  $3.6$  V: external analog power supplies for ADC, Reset blocks, RCs and PLL (minimum voltage to be applied to  $V_{DDA}$  is  $2.4$  V when the ADC is used).  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ , respectively.
- $V_{BAT} = 1.8$  to  $3.6$  V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

For more details on how to connect power pins, refer to [Figure 11: Power supply scheme](#).

### Power supply supervisor

The device has an integrated power-on reset (POR)/power-down reset (PDR) circuitry. It is always active, and ensures proper operation starting from/down to  $2$  V. The device remains in reset mode when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$ , without the need for an external reset circuit.

The device features an embedded programmable voltage detector (PWD) that monitors the  $V_{DD}$  power supply and compares it to the  $V_{PWD}$  threshold. An interrupt can be generated when  $V_{DD}$  drops below the  $V_{PWD}$  and/or when  $V_{DD}$  is higher than the  $V_{PWD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PWD is enabled by software. Refer to [Table 11: Embedded reset and power control block characteristics](#) for the values of  $V_{POR/PDR}$  and  $V_{PWD}$ .

### Voltage regulator

The regulator has three operation modes: main (MR), low power (LPR) and power down.

- MR is used in the nominal regulation mode (Run).
- LPR is used in the Stop modes.
- Power down is used in Standby mode: the regulator output is in high impedance: the kernel circuitry is powered down, inducing zero consumption (but the contents of the registers and SRAM are lost)

This regulator is always enabled after reset. It is disabled in Standby mode.

### Low-power modes

The STM32F103xC, STM32F103xD and STM32F103xE performance line supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Sleep mode**  
In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.
- **Stop mode**  
Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the  $1.8$  V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.  
The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm or the USB wakeup.

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.8 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the Backup domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm occurs.

*Note:* *The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop or Standby mode.*

## DMA

The flexible 12-channel general-purpose DMAs (7 channels for DMA1 and 5 channels for DMA2) are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The two DMA controllers support circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for software trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I<sup>2</sup>C, USART, general-purpose, basic and advanced control timers TIMx, DAC, I<sup>2</sup>S, SDIO and ADC.

## RTC (real-time clock) and backup registers

The RTC and the backup registers are supplied through a switch that takes power either on V<sub>DD</sub> supply when present or through the V<sub>BAT</sub> pin. The backup registers are forty-two 16-bit registers used to store 84 bytes of user application data. They are not reset by a system or power reset, and they are not reset when the device wakes up from the Standby mode.

The real-time clock provides a set of continuously running counters which can be used with suitable software to provide a clock calendar function, and provides an alarm interrupt and a periodic interrupt. It is clocked by a 32.768 kHz external crystal, resonator or oscillator, the internal low power RC oscillator or the high-speed external clock divided by 128. The internal low-speed RC has a typical frequency of 40 kHz. The RTC can be calibrated using an external 512 Hz output to compensate for any natural quartz deviation. The RTC features a 32-bit programmable counter for long term measurement using the Compare register to generate an alarm. A 20-bit prescaler is used for the time base clock and is by default configured to generate a time base of 1 second from a clock at 32.768 kHz.

## Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

### Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

### General-purpose timers (TIMx)

There are up to 4 synchronizable standard timers (TIM2, TIM3, TIM4 and TIM5) embedded in the STM32F103xC, STM32F103xD and STM32F103xE performance line devices. These timers are based on a 16-bit auto-reload up/down counter, a 16-bit prescaler and feature 4 independent channels each for input capture/output compare, PWM or one pulse mode output. This gives up to 16 input captures / output compares / PWMs on the largest packages. They can work together with the Advanced Control timer via the Timer Link feature for synchronization or event chaining.

The counter can be frozen in debug mode.

Any of the standard timer's can be used to generate PWM outputs. Each of the timers has independent DMA request generations.

### Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger generation. They can also be used as a generic 16-bit time base.

### Advanced control timers (TIM1 and TIM8)

The two advanced control timers (TIM1 and TIM8) can each be seen as a three-phase PWM multiplexed on 6 channels. They can also be seen as a complete general-purpose timer. The 4 independent channels can be used for

- Input Capture
- Output Compare
- PWM generation (edge or center-aligned modes)
- One-pulse mode output
- Complementary PWM outputs with programmable inserted dead-times.

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard TIM timers which have the same architecture. The advanced control timer can therefore work together with the TIM timers via the Timer Link feature for synchronization or event chaining.

Description	STM32F103xC, STM32F103xD, STM32F103xE
-------------	---------------------------------------

### I<sup>2</sup>C bus

Up to two I<sup>2</sup>C bus interfaces can operate in multimaster and slave modes. They can support standard and fast modes.

They support 7/10-bit addressing mode and 7-bit dual addressing mode (as slave). A hardware CRC generation/verification is embedded.

They can be served by DMA and they support SMBus 2.0/PMBus.

### Universal synchronous/asynchronous receiver transmitters (USARTs)

The STM32F103xC, STM32F103xD and STM32F103xE performance line embeds three universal synchronous/asynchronous receiver transmitters (USART1, USART2 and USART3) and two universal asynchronous receiver transmitters (UART4 and UART5).

These five interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability.

The USART1 interface is able to communicate at speeds of up to 4.5 Mbit/s. The other available interfaces communicate at up to 2.25 Mbit/s.

USART1, USART2 and USART3 also provide hardware management of the CTS and RTS signals, Smart Card mode (ISO 7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controller except for UART5.

### Serial peripheral interface (SPI)

Up to three SPIs are able to communicate up to 18 Mbits/s in slave and master modes in full-duplex and simplex communication modes. The 3-bit prescaler gives 3 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes.

All SPIs can be served by the DMA controller.

### Inter-integrated sound (I<sup>2</sup>S)

Two standard I<sup>2</sup>S interfaces (multiplexed with SPI2 and SPI3) are available, that can be operated in master or slave mode. These interfaces can be configured to operate with 16/32 bit resolution, as input or output channels. Audio sampling frequencies from 8 kHz up to 48 kHz are supported. When either or both of the I<sup>2</sup>S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

### SDIO

An SD/SDIO/MMC host interface is available, that supports MultiMediaCard System Specification Version 4.2 in three different databus modes: 1-bit (default), 4-bit and 8-bit. The interface allows data transfer at up to 48 MHz in 8-bit mode, and is compliant with SD Memory Card Specifications Version 2.0.

The SDIO Card Specification Version 2.0 is also supported with two different databus modes: 1-bit (default) and 4-bit.

The current version supports only one SD/SDIO/MMC4.2 card at any one time and a stack of MMC4.1 or previous.

In addition to SD/SDIO/MMC, this interface is also fully compliant with the CE-ATA digital protocol Rev1.1.

**Controller area network (CAN)**

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

**Universal serial bus (USB)**

The STM32F103xC, STM32F103xD and STM32F103xE performance line embed a USB device peripheral compatible with the USB full-speed 12 Mbs. The USB interface implements a full-speed (12 Mbit/s) function interface. It has software-configurable endpoint setting and suspend/resume support. The dedicated 48 MHz clock is generated from the internal main PLL (the clock source must use a HSE crystal oscillator).

**GPIOs (general-purpose inputs/outputs)**

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current-capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

I/Os on APB2 with up to 18 MHz toggling speed

**ADC (analog to digital converter)**

Three 12-bit analog-to-digital converters are embedded into STM32F103xC, STM32F103xD and STM32F103xE performance line devices and each ADC shares up to 21 external channels, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold
- Single shunt

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the standard timers (TIMx) and the advanced-control timers (TIM1 and TIM8) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

### DAC (digital-to-analog converter)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This dual digital Interface supports the following features:

- two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- left or right data alignment in 12-bit mode
- synchronized update capability
- noise-wave generation
- triangular-wave generation
- dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- external triggers for conversion
- input voltage reference  $V_{REF+}$

Eight DAC trigger inputs are used in the STM32F103xC, STM32F103xD and STM32F103xE performance line family. The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

### Temperature sensor

The temperature sensor has to generate a linear voltage with any variation in temperature. The conversion range is between  $2 \text{ V} < V_{TDA} < 3.6 \text{ V}$ . The temperature sensor is internally connected to the ADC1\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

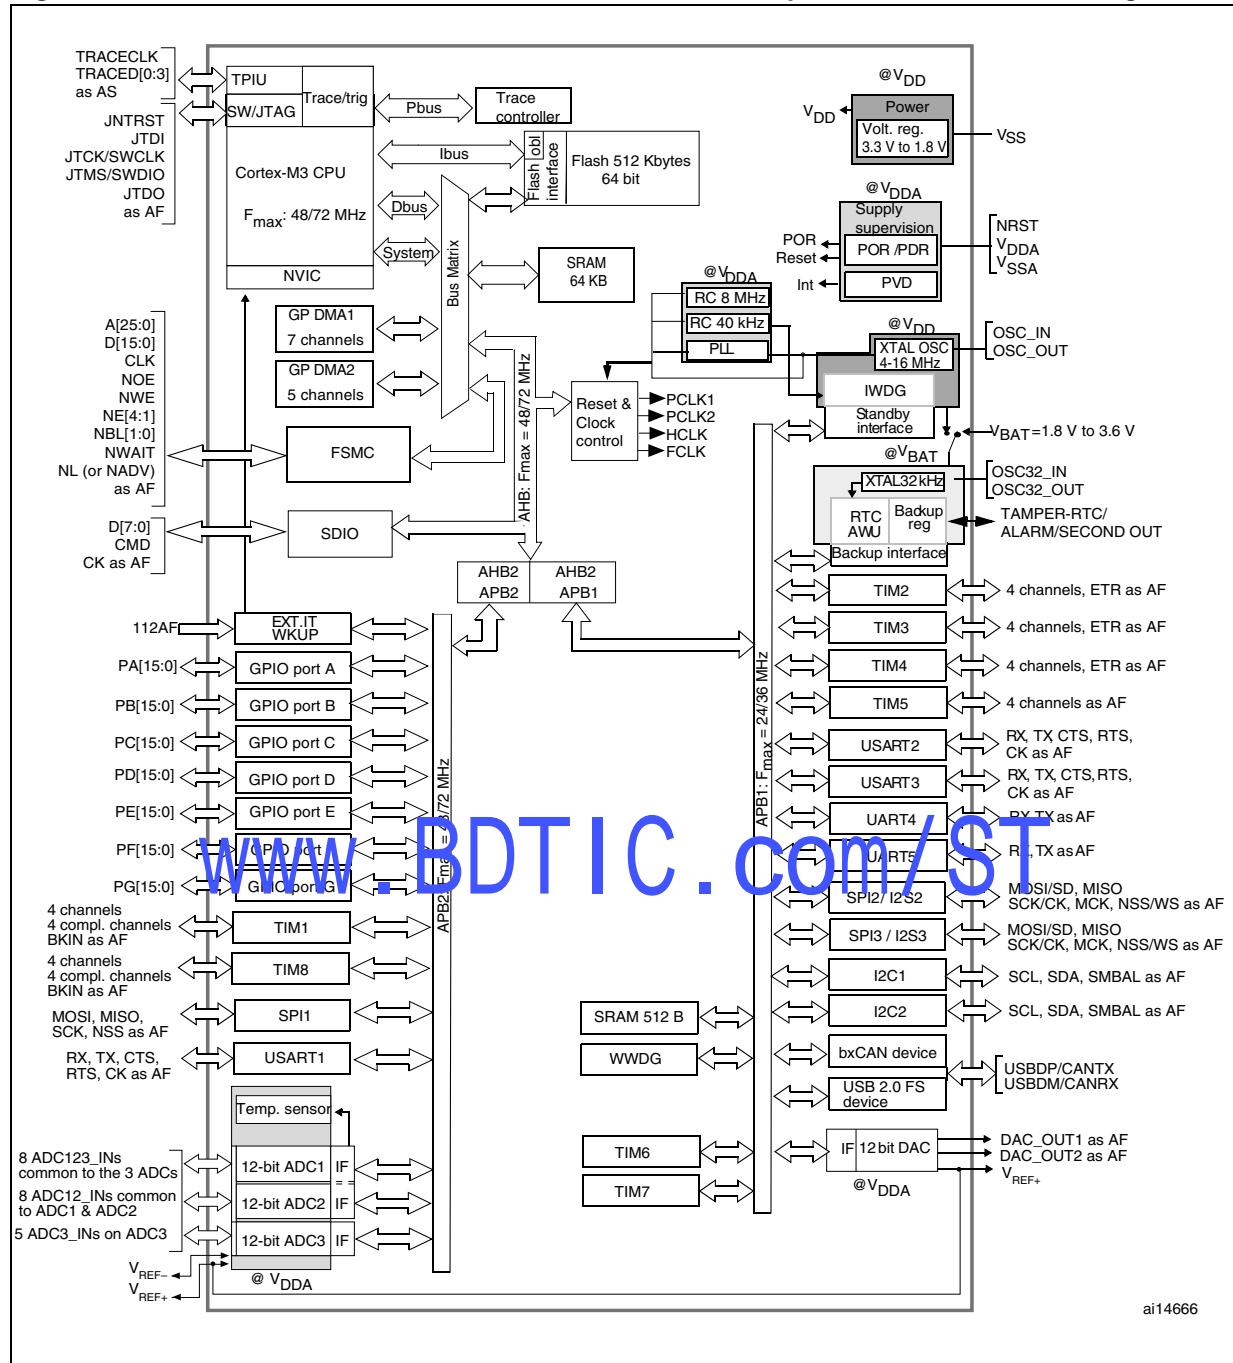

### Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### Embedded Trace Macrocell™

The ARM® Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F10xxx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

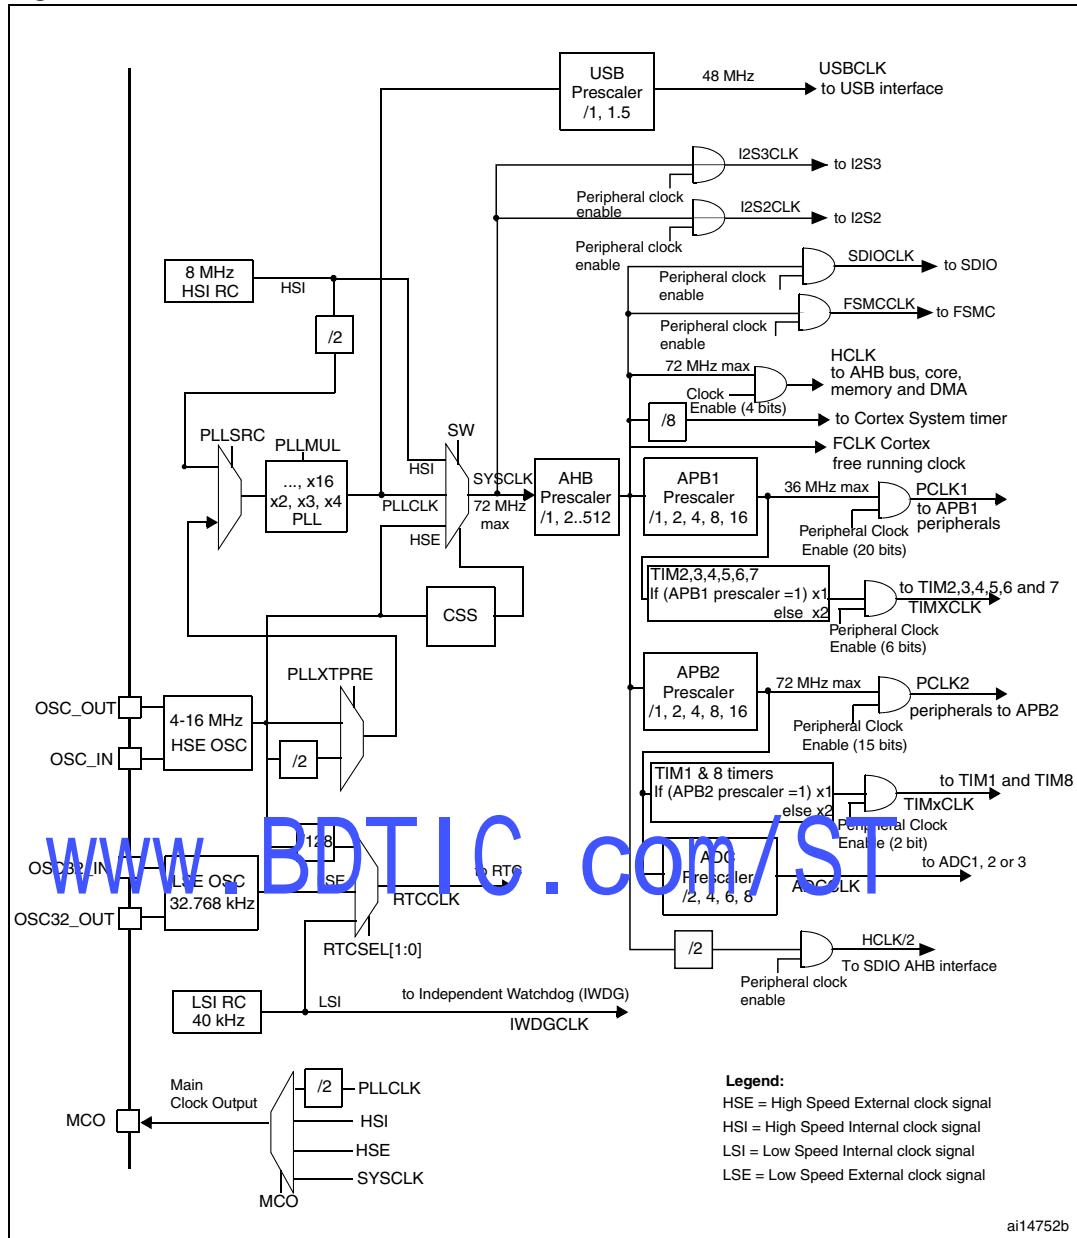

Figure 1. STM32F103xC, STM32F103xD and STM32F103xE performance line block diagram

1.  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$  (suffix 6, see [Table 69](#)) or  $-40^\circ\text{C}$  to  $+105^\circ\text{C}$  (suffix 7, see [Table 69](#)), junction temperature up to  $105^\circ\text{C}$  or  $125^\circ\text{C}$ , respectively.

2. AF = alternate function on I/O port pin.

Figure 2. Clock tree

- When the HSI is used as a PLL clock input, the maximum system clock frequency that can be achieved is 64 MHz.
- For the USB function to be available, both HSE and PLL must be enabled, with the CPU running at either 48 MHz or 72 MHz.
- To have an ADC conversion time of 1  $\mu$ s, APB2 must be at 14 MHz, 28 MHz or 56 MHz.

F5	F5	64	100	144	V <sub>DD_3</sub>	S		V <sub>DD_3</sub>		

1. I = input, O = output, S = supply, HiZ = high impedance.

2. FT = 5 V tolerant.

3. Function availability depends on the chosen device.

4. PC13, PC14 and PC15 are supplied through the power switch, and so their use in output mode is limited: they can be used only in output 2 MHz mode with a maximum load of 30 pF and only one pin can be put in output mode at a time.

5. Main function after the first backup domain power-up. Later on, it depends on the contents of the Backup registers even after reset (because these registers are not reset by the main reset). For details on how to manage these IOs, refer to the Battery backup domain and BKP register description sections in the STM32F10xxx reference manual, available from the STMicroelectronics website: [www.st.com](http://www.st.com).

6. This alternate function can be remapped by software to some other port pins (if available on the used package). For more details, refer to the Alternate function I/O and debug configuration section in the STM32F10xxx reference manual, available from the STMicroelectronics website: [www.st.com](http://www.st.com).

7. For the LQFP64 package, the pins number 5 and 6 are configured as OSC\_IN/OSC\_OUT after reset, however the functionality of PD0 and PD1 can be remapped by software on these pins. For the LQFP100/BGA100 and LQFP144/BGA144 packages, PD0 and PD1 are available by default, so there is no need for remapping. For more details, refer to Alternate function I/O and debug configuration section in the STM32F10xxx reference manual.

1. Ports F and G are not available in devices delivered in 100-pin packages.

## 4 Memory mapping

The memory map is shown in *Figure 8*.

**Figure 8. Memory map**

## 5 Electrical characteristics

### 5.1 Test conditions

Unless otherwise specified, all voltages are referenced to V<sub>SS</sub>.

#### 5.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T<sub>A</sub> = 25 °C and T<sub>A</sub> = T<sub>Amax</sub> (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean±3Σ).

#### 5.1.2 Typical values

Unless otherwise specified, typical data are based on T<sub>A</sub> = 25 °C, V<sub>DD</sub> = 3.3 V (for the 2 V ≤ V<sub>DD</sub> ≤ 3.6 V voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean±2Σ).

#### 5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

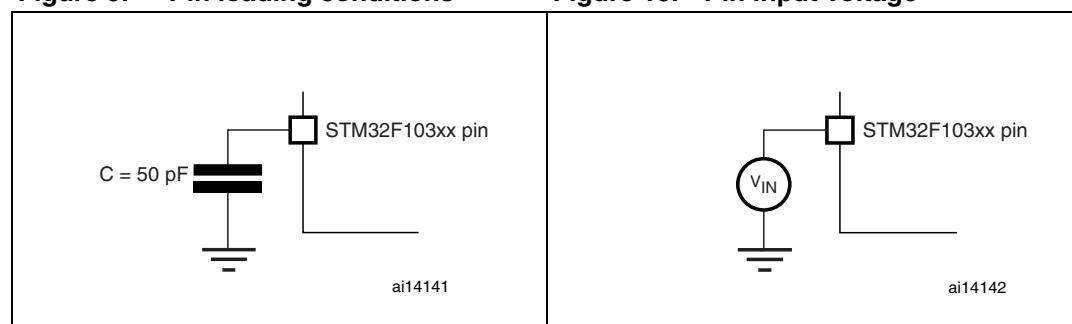

#### 5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 9](#).

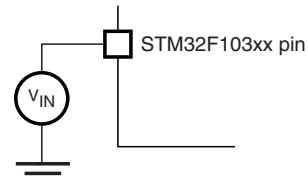

#### 5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 10](#).

**Figure 9. Pin loading conditions**

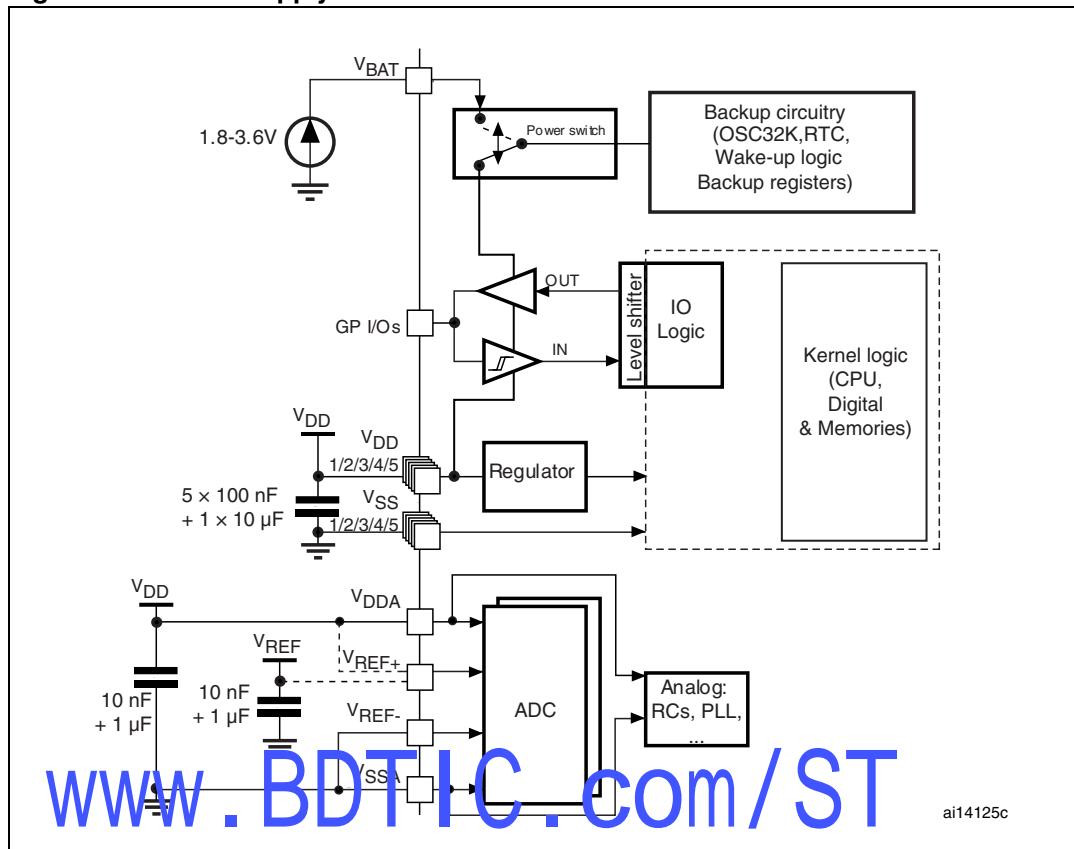

**Figure 10. Pin input voltage**

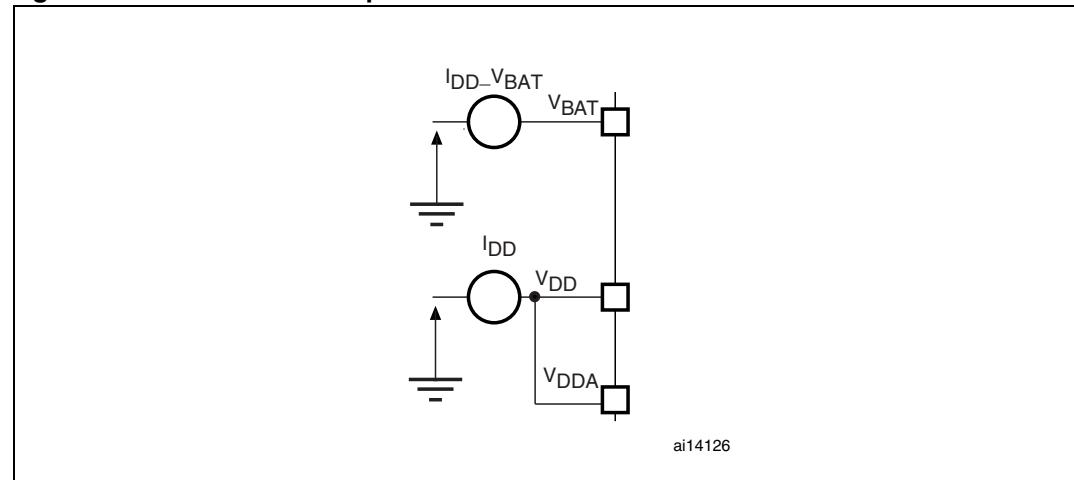

### 5.1.6 Power supply scheme

Figure 11. Power supply scheme

### 5.1.7 Current consumption measurement

Figure 12. Current consumption measurement scheme

## 5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 6: Voltage characteristics](#), [Table 7: Current characteristics](#), and [Table 8: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 6. Voltage characteristics**

Symbol	Ratings	Min	Max	Unit
$V_{DD}-V_{SS}$	External main supply voltage (including $V_{DDA}$ and $V_{DD}$ ) <sup>(1)</sup>	-0.3	4.0	V
$V_{IN}$	Input voltage on five volt tolerant pin <sup>(2)</sup>	$V_{SS}-0.3$	+5.5	
	Input voltage on any other pin <sup>(2)</sup>	$V_{SS}-0.3$	$V_{DD}+0.3$	
$ ΔV_{DDx} $	Variations between different power pins	50	50	mV
$ V_{SSx}-V_{SSl} $	Variations between all the different ground pins	50	50	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see <a href="#">Section 5.3.12: Absolute maximum ratings (electrical sensitivity)</a>		

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $I_{INJ(PIN)}$  must never be exceeded (see [Table 7: Current characteristics](#)). This is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{INJ(PIN)}$  value. A positive injection is induced by  $V_{IN}>V_{DD}$  while a negative injection is induced by  $V_{IN}<V_{SS}$ .

**Table 7. Current characteristics**

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}$ power lines (source) <sup>(1)</sup>	150	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground lines (sink) <sup>(1)</sup>	150	
$I_{IO}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/Os and control pin	-25	
$I_{INJ(PIN)}$ <sup>(2)(3)</sup>	Injected current on NRST pin	± 5	
	Injected current on HSE OSC_IN and LSE OSC_IN pins	± 5	
	Injected current on any other pin <sup>(4)</sup>	± 5	
$ΣI_{INJ(PIN)}$ <sup>(2)</sup>	Total injected current (sum of all I/O and control pins) <sup>(4)</sup>	± 25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $I_{INJ(PIN)}$  must never be exceeded. This is implicitly insured if  $V_{IN}$  maximum is respected. If  $V_{IN}$  maximum cannot be respected, the injection current must be limited externally to the  $I_{INJ(PIN)}$  value. A positive injection is induced by  $V_{IN}>V_{DD}$  while a negative injection is induced by  $V_{IN}<V_{SS}$ .
3. Negative injection disturbs the analog performance of the device. See note in [Section 5.3.18: 12-bit ADC characteristics](#).
4. When several inputs are submitted to a current injection, the maximum  $ΣI_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with  $ΣI_{INJ(PIN)}$  maximum current injection on four I/O port pins of the device.

**Table 8. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	°C

## 5.3 Operating conditions

### 5.3.1 General operating conditions

**Table 9. General operating conditions**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{HCLK}$	Internal AHB clock frequency		0	72	MHz
$f_{PCLK1}$	Internal APB1 clock frequency		0	36	
$f_{PCLK2}$	Internal APB2 clock frequency		0	72	
$V_{DD}$	Standard operating voltage		2	3.6	V
$V_{BAT}$	Backup operating voltage		1.8	3.6	V
$P_D$	Power dissipation at $T_A = 85^\circ\text{C}$ for suffix 6 or $T_A = 105^\circ\text{C}$ for suffix 7 <sup>(1)</sup>	LQFP144		TBD <sup>(2)</sup>	mW
		LQFP100		434	
		LQFP64		444	
		LFBGA100		487	
		LFBGA144		TBD <sup>(2)</sup>	
$T_A$	Ambient temperature for 6 suffix version	Maximum power dissipation	-40	85	°C
		Low power dissipation <sup>(3)</sup>	-40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	-40	105	°C
		Low power dissipation <sup>(3)</sup>	-40	125	
$T_J$	Junction temperature range	6 suffix version	-40	105	°C
		7 suffix version	-40	125	

- If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$  (see [Table 6.2: Thermal characteristics on page 113](#)).
- TBD = to be determined.
- In low power dissipation state,  $T_A$  can be extended to this range as long as  $T_J$  does not exceed  $T_{Jmax}$  (see [Table 6.2: Thermal characteristics on page 113](#)).

### 5.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 10](#) are derived from tests performed under the ambient temperature condition summarized in [Table 9](#).

**Table 10. Operating conditions at power-up / power-down**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDD}$	$V_{DD}$ rise time rate		0	$\infty$	$\mu\text{s}/\text{V}$
	$V_{DD}$ fall time rate		20	$\infty$	

### 5.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 11](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 11. Embedded reset and power control block characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{PVD}$	Programmable voltage detector level selection	PLS[2:0]=000 (rising edge)	2.1	2.18	2.26	V
		PLS[2:0]=000 (falling edge)	2	2.08	2.16	V
		PLS[2:0]=001 (rising edge)	2.19	2.28	2.37	V
		PLS[2:0]=001 (falling edge)	2.09	2.18	2.27	V
		PLS[2:0]=010 (rising edge)	2.28	2.38	2.48	V
		PLS[2:0]=010 (falling edge)	2.18	2.28	2.38	V
		PLS[2:0]=011 (rising edge)	2.38	2.48	2.58	V
		PLS[2:0]=011 (falling edge)	2.28	2.38	2.48	V
		PLS[2:0]=100 (rising edge)	2.47	2.58	2.69	V
		PLS[2:0]=100 (falling edge)	2.37	2.48	2.59	V
		PLS[2:0]=101 (rising edge)	2.57	2.68	2.79	V
		PLS[2:0]=101 (falling edge)	2.47	2.58	2.69	V
		PLS[2:0]=110 (rising edge)	2.66	2.78	2.9	V
		PLS[2:0]=110 (falling edge)	2.56	2.68	2.8	V
		PLS[2:0]=111 (rising edge)	2.76	2.88	3	V
		PLS[2:0]=111 (falling edge)	2.66	2.78	2.9	V
$V_{PVDhyst}^{(2)}$	PVD hysteresis			100		mV
$V_{POR/PDR}$	Power on/power down reset threshold	Falling edge	1.8 <sup>(1)</sup>	1.88	1.96	V
		Rising edge	1.84	1.92	2.0	V
$V_{PDRhyst}$	PDR hysteresis			40		mV
$T_{RSTTEMPO}^{(2)}$	Reset temporization		1	2.5	4.5	ms

1. The product behavior is guaranteed by design down to the minimum  $V_{POR/PDR}$  value.

2. Guaranteed by design, not tested in production.

### 5.3.4 Embedded reference voltage

The parameters given in [Table 12](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 12. Embedded internal reference voltage**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	-40 °C < $T_A$ < +105 °C	1.16	1.20	1.26	V
		-40 °C < $T_A$ < +85 °C	1.16	1.20	1.24	V
$T_{S\_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage			5.1	17.1	μs

1. Shortest sampling time can be determined in the application by multiple iterations.

### 5.3.5 Supply current characteristics

The current consumption is measured as described in [Figure 12: Current consumption measurement scheme](#).

#### Maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above)
- Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled  $f_{PCLK1} = f_{HCLK}/2$ ,  $f_{PCLK2} = f_{HCLK}$

The parameters given in [Table 13](#), [Table 14](#) and [Table 15](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 13. Maximum current consumption in Run mode, code with data processing running from Flash**

Symbol	Parameter	Conditions	$f_{HCLK}$	Max <sup>(1)</sup>		Unit
				$T_A = 85^\circ C$	$T_A = 105^\circ C$

		Low-speed internal RC oscillator ON, independent watchdog OFF	2.8	3.6	TBD	TBD	
		Low-speed internal RC oscillator and independent watchdog OFF, low-speed oscillator and RTC OFF	1.9	2.1	5 <sup>(5)</sup>	6.5 <sup>(5)</sup>	
I <sub>DD_VBAT</sub>	Backup domain supply current	Low-speed oscillator and RTC ON	1.1	1.4	TBD <sup>(5)</sup>	TBD <sup>(5)</sup>	

1. TBD stands for to be determined.
2. Typical values are measured at T<sub>A</sub> = 25 °C, V<sub>DD</sub> = 3.3 V, unless otherwise specified.
3. Data based on characterization results, tested in production at V<sub>DD</sub>max and f<sub>QCKX</sub>max.
4. To have the Standby consumption with RTC ON add I<sub>DD\_VBAT</sub> (Low-speed oscillator and RTC ON) to I<sub>DD</sub> Standby (when V<sub>DD</sub> is present the Backup Domain is powered by V<sub>DD</sub> supply).
5. Data based on characterization results, not tested in production.

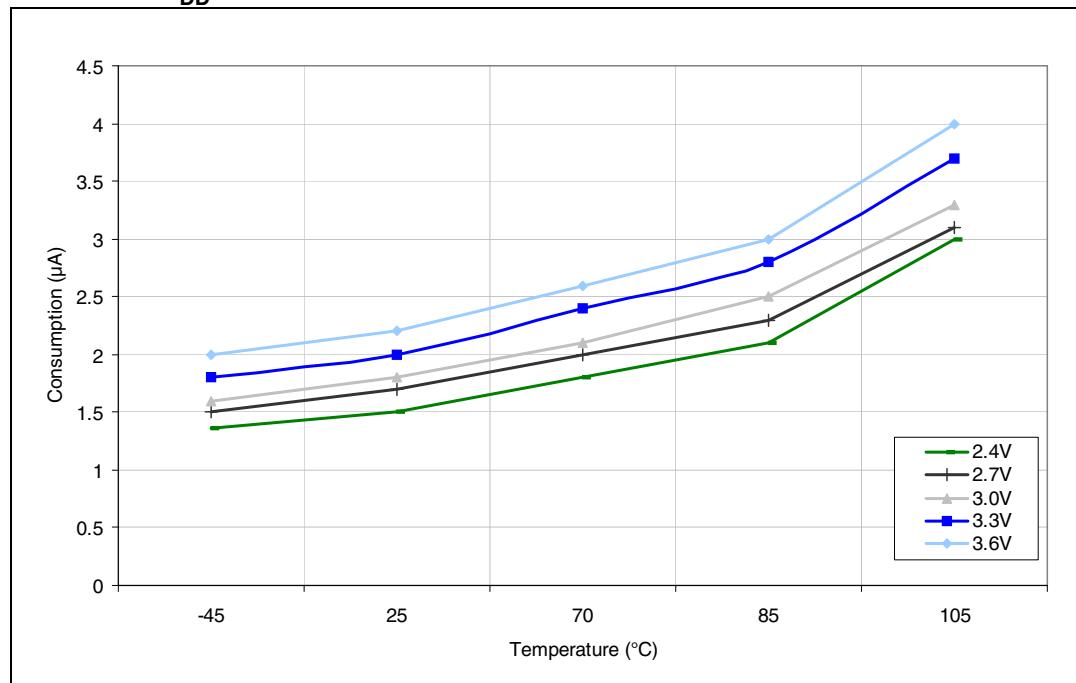

**Figure 15. Current consumption in Stop mode with regulator in main mode versus temperature at different  $V_{DD}$  values**

**Figure 16. Current consumption in Stop mode with regulator in low-power mode versus temperature at different  $V_{DD}$  values**

**Figure 17. Current consumption in Standby mode versus temperature at different  $V_{DD}$  values**

### Typical current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load).
  - All peripherals are disabled except if it is explicitly mentioned.
  - The Flash access time is adjusted to  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).
  - Ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).
  - Prefetch is ON (Reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled  $f_{PCLK1} = f_{HCLK}/4$ ,  $f_{PCLK2} = f_{HCLK}/2$ ,  $f_{ADCCLK} = f_{PCLK2}/4$

**Table 17. Typical current consumption in Run mode, code with data processing running from Flash**

Symbol	Parameter	Conditions	$f_{HCLK}$	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
$I_{DD}$	Supply current in Run mode	External clock <sup>(3)</sup>  Running on high speed internal RC (HS), AHE prescaler used to reduce the frequency	72 MHz	51	30.5	mA
			48 MHz	34.6	20.7	
			36 MHz	26.6	16.2	
			24 MHz	18.5	11.4	
			16 MHz	12.8	8.2	
			8 MHz	7.2	5	
			4 MHz	4.2	3.1	
			2 MHz	2.7	2.1	
			1 MHz	2	1.7	
			500 kHz	1.6	1.4	
			125 kHz	1.3	1.2	
			64 MHz	45	27	mA
			48 MHz	34	20.1	
			36 MHz	26	15.6	
			24 MHz	17.9	10.8	
			16 MHz	12.2	7.6	
			8 MHz	6.6	4.4	
			4 MHz	3.6	2.5	
			2 MHz	2.1	1.5	
			1 MHz	1.4	1.1	
			500 kHz	1	0.8	
			125 kHz	0.7	0.6	

1. Typical values are measures at  $T_A = 25^\circ\text{C}$ ,  $V_{DD} = 3.3\text{ V}$ .
2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC\_CR2 register).
3. External clock is 8 MHz and PLL is on when  $f_{HCLK} > 8\text{ MHz}$ .

**Table 18. Typical current consumption in Sleep mode, code with data processing code running from Flash or RAM**

Symbol	Parameter	Conditions	$f_{HCLK}$	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
$I_{DD}$	Supply current in Sleep mode	External clock <sup>(3)</sup>	72 MHz	29.5	6.4	mA
			48 MHz	20	4.6	
			36 MHz	15.1	3.6	
			24 MHz	10.4	2.6	
			16 MHz	7.2	2	
			8 MHz	3.9	1.3	
			4 MHz	2.6	1.2	
			2 MHz	1.85	1.15	
			1 MHz	1.5	1.1	
			500 kHz	1.3	1.05	
		Running on high speed internal RC (HSI), AHB prescaler used to reduce the frequency	125 kHz	1.2	1.05	
			64 MHz	25.6	5.1	
			48 MHz	19.4	4	
			36 MHz	14.5	3	
			24 MHz	9.5	2	
			16 MHz	6.6	1.4	
			8 MHz	3.3	0.7	
			4 MHz	2	0.6	
			2 MHz	1.25	0.55	
			1 MHz	0.9	0.5	
			500 kHz	0.7	0.45	
			125 kHz	0.6	0.45	

1. Typical values are measures at  $T_A = 25^\circ\text{C}$ ,  $V_{DD} = 3.3\text{ V}$ .
2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC\_CR2 register).
3. External clock is 8 MHz and PLL is on when  $f_{HCLK} > 8\text{ MHz}$ .

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in [Table 19](#). The MCU is placed under the following conditions:

- all I/O pins are in input mode with a static value at V<sub>DD</sub> or V<sub>SS</sub> (no load)
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on
- ambient operating temperature and V<sub>DD</sub> supply voltage conditions summarized in [Table 6](#)

**Table 19. Peripheral current consumption<sup>(1)</sup>**

Peripheral	Typical consumption at 25 °C	Unit
TIM2	1.2	mA
TIM3	1.2	
TIM4	1.2	
TIM5	1.2	
TIM6	0.4	
TIM7	0.4	
SPI2	0.2	
SPI3	0.2	
USART2	0.4	
USART3	0.4	
UART4	0.5	
UART5	0.6	
I2C1	0.4	
I2C2	0.4	
USB	0.65	
CAN	0.72	
DAC	0.72	

**Table 19.** Peripheral current consumption<sup>(1)</sup> (continued)

Peripheral	Typical consumption at 25 °C	Unit
APB2	GPIOA	0.55
	GPIOB	0.72
	GPIOC	0.72
	GPIOD	0.55
	GPIOE	1
	GPIOF	0.72
	GPIOG	1
	ADC1 <sup>(2)</sup>	1.9
	ADC2	1.7
	TIM1	1.8
	SPI1	0.4
	TIM8	1.7
	USART1	0.9
	ADC3	1.7

1.  $f_{HCLK} = 72$  MHz,  $f_{APB1} = f_{HCLK}/2$ ,  $f_{APB2} = f_{HCLK}$ , default prescaler value for each peripheral.

2. Specific conditions for ADC:  $f_{HCLK} = 56$  MHz,  $f_{APB1} = f_{HCLK}/2$ ,  $f_{APB2} = f_{HCLK}$ ,  $f_{ADCCLK} = f_{APB2}/4$ , ADON bit in the ADC\_CR2 register is set to 1.

### 5.3.6

## External clock source characteristics

### High-speed external user clock

The characteristics given in *Table 20* result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in *Table 9*.

**Table 20.** High-speed external (HSE) user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency <sup>(1)</sup>			8	25	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		0.7 $V_{DD}$		$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$		0.3 $V_{DD}$	
$t_w(HSE)$ $t_w(HSE)$	OSC_IN high or low time <sup>(1)</sup>		16			ns
$t_r(HSE)$ $t_f(HSE)$	OSC_IN rise or fall time <sup>(1)</sup>				5	
$I_L$	OSC_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			$\pm 1$	$\mu A$

1. Value based on design simulation and/or technology characteristics. It is not tested in production.

### Low-speed external user clock

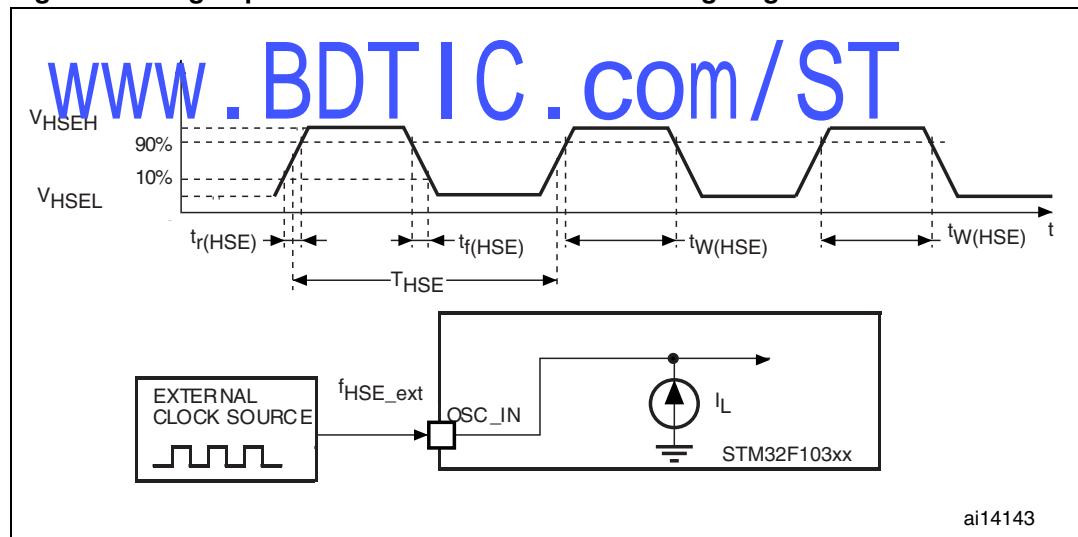

The characteristics given in [Table 21](#) result from tests performed using an low-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 9](#).

**Table 21. Low-speed external user clock characteristics**

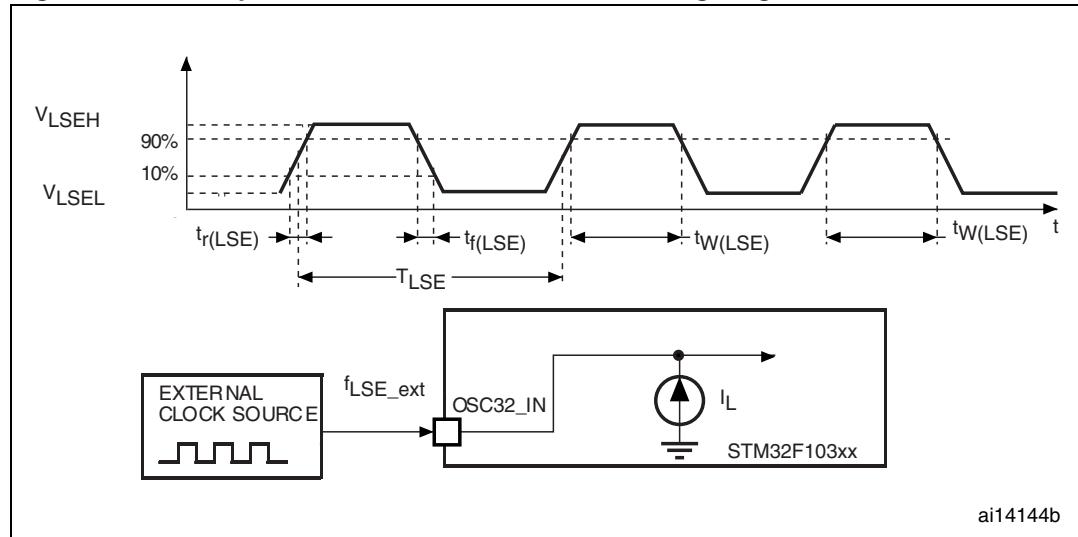

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User External clock source frequency <sup>(1)</sup>			32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage		0.7V <sub>DD</sub>		V <sub>DD</sub>	V
$V_{LSEL}$	OSC32_IN input pin low level voltage		V <sub>SS</sub>		0.3V <sub>DD</sub>	
$t_w(LSE)$ $t_w(LSE)$	OSC32_IN high or low time <sup>(1)</sup>		450			ns
$t_r(LSE)$ $t_f(LSE)$	OSC32_IN rise or fall time <sup>(1)</sup>				5	
$I_L$	OSC32_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			$\pm 1$	µA

1. Value based on design simulation and/or technology characteristics. It is not tested in production.

**Figure 18. High-speed external clock source AC timing diagram**

ai14143

**Figure 19. Low-speed external clock source AC timing diagram**

ai14144b

[www.BDTIC.com/ST](http://www.BDTIC.com/ST)

### High-speed external clock

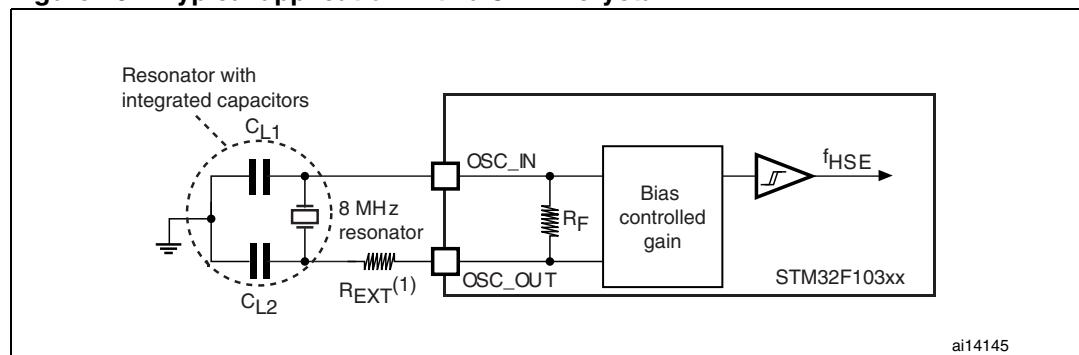

The high-speed external (HSE) clock can be supplied with a 4 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 22](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 22. HSE 4-16 MHz oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{OSC\_IN}$	Oscillator frequency		4	8	16	MHz
$R_F$	Feedback resistor			200		kΩ
$C_{L1}$ $C_{L2}^{(2)}$	Recommended load capacitance versus equivalent serial resistance of the crystal ( $R_S$ ) <sup>(3)</sup>	$R_S = 30 \Omega$		30		pF
$i_2$	HSE driving current	$V_{DD} = 3.3 \text{ V}$ $V_{IN} = V_{SS}$ with 30 pF load			1	mA
$g_m^{(4)}$	Oscillator transconductance	Startup	25			mA/V
$t_{SU(HSE)}^{(5)}$	startup time	$V_{DD}$ is stabilized		2		ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
2. For  $C_{L1}$  and  $C_{L2}$  it is recommended to use high-quality ceramic capacitors in the  $5 \text{ pF} \text{ to } 25 \text{ pF}$  range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator.  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included when sizing  $C_{L1}$  and  $C_{L2}$  (10 pF can be used as a rough estimate of the combined pin and board capacitance).
3. The relatively low value of the RF resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the MCU is used in tough humidity conditions.
4. Based on characterization results, not tested in production.
5.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

**Figure 20. Typical application with a 8-MHz crystal**

1.  $R_{EXT}$  value depends on the crystal characteristics. Typical value is in the range of 5 to  $6R_S$ .

### Low-speed external clock

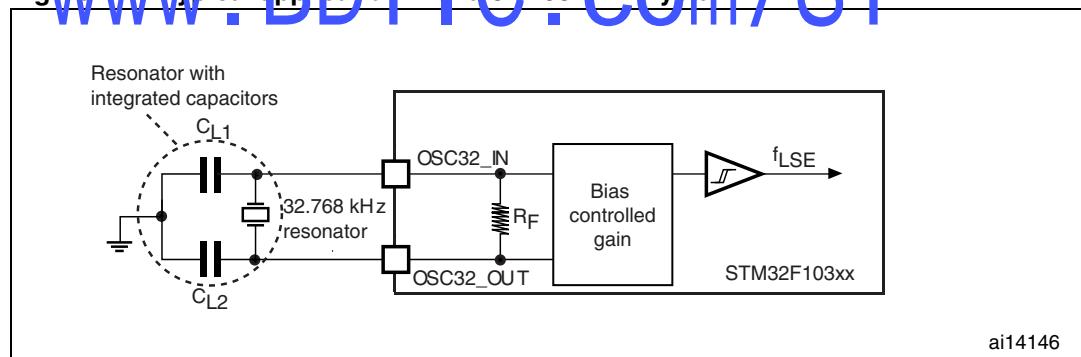

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 23](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 23. LSE oscillator characteristics ( $f_{LSE} = 32.768 \text{ kHz}$ )**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_F$	Feedback resistor			5		$\text{M}\Omega$
$C_{L1}$ $C_{L2}$	Recommended load capacitance versus equivalent serial resistance of the crystal ( $R_S$ ) <sup>(1)</sup>	$R_S = 30 \text{ k}\Omega$			15	$\text{pF}$
$I_2$	LSE driving current	$V_{DD} = 3.3 \text{ V}$ $V_{IN} = V_{SS}$			1.4	$\mu\text{A}$
$g_m$	Oscillator Transconductance		5			$\mu\text{A/V}$
$t_{SU(LSE)}$ <sup>(2)</sup>	startup time	$V_{DD}$ is stabilized		3		s

1. The oscillator selection can be optimized in terms of supply current using an high quality resonator with small  $R_S$  value for example MSIV-TIN32.768kHz. Refer to crystal manufacturer for more details
2.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

**Figure 21. Typical application with a 32.768 kHz crystal**

ai14146

### 5.3.7 Internal clock source characteristics

The parameters given in [Table 24](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

#### High-speed internal (HSI) RC oscillator

**Table 24. HSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI}$	Frequency			8		MHz
$ACC_{HSI}$	Accuracy of HSI oscillator	$T_A = -40$ to $105^\circ C$			$\pm 3^{(2)}$	%
		$T_A = 25^\circ C$		$\pm 1$	$\pm 2$	%
$t_{su(HSI)}$	HSI oscillator start up time		1		2	$\mu s$
$I_{DD(HSI)}$	HSI oscillator power consumption			80	100	$\mu A$

1.  $V_{DD} = 3.3$  V,  $T_A = -40$  to  $105^\circ C$  unless otherwise specified.

2. Values based on device characterization, not tested in production.

#### LSI low speed internal RC oscillator

**Table 25. LSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min <sup>(2)</sup>	Typ	Max	Unit
$f_{LSI}$	Frequency		30	40	60	kHz
$t_{su(LSI)}$	LSI oscillator start up time				85	$\mu s$
$I_{DD(LSI)}$	LSI oscillator power consumption			0.65	1.2	$\mu A$

1.  $V_{DD} = 3$  V,  $T_A = -40$  to  $105^\circ C$  unless otherwise specified.

2. Value based on device characterization, not tested in production.

### Wakeup time from low-power mode

The wakeup times given in [Table 26](#) is measured on a wakeup phase with a 8-MHz HSI RC oscillator. The clock source used to wake up the device depends from the current operating mode:

- Stop or Standby mode: the clock source is the RC oscillator
- Sleep mode: the clock source is the clock that was set before entering Sleep mode.

All timings are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 26. Low-power mode wakeup timings**

Symbol	Parameter	Conditions	Typ	Unit
$t_{WUSLEEP}^{(1)}$	Wakeup from Sleep mode	Wakeup on HSI RC clock	1.8	μs
$t_{WUSTOP}^{(1)}$	Wakeup from Stop mode (regulator in run mode)	HSI RC wakeup time = 2 μs	3.6	μs
	Wakeup from Stop mode (regulator in low power mode)	HSI RC wakeup time = 2 μs, Regulator wakeup from LP mode time = 5 μs	5.4	
$t_{WUSTDBY}^{(1)}$	Wakeup from Standby mode	HSI RC wakeup time = 2 μs, Regulator wakeup from power down time = 38 μs	50	μs

1. The wakeup times are measured from the wakeup event to the point in which the user application code reads the first instruction.

### 5.3.8 PLL characteristics

## www.BDTIC.com/ST

The parameters given in [Table 27](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 27. PLL characteristics**

Symbol	Parameter	Test conditions	Value			Unit
			Min	Typ	Max <sup>(1)</sup>	
$f_{PLL\_IN}$	PLL input clock			8.0		MHz
	PLL input clock duty cycle		40		60	%
$f_{PLL\_OUT}$	PLL multiplier output clock		16		72	MHz
$t_{LOCK}$	PLL lock time				200	μs

1. Data based on device characterization, not tested in production.

### 5.3.9 Memory characteristics

#### Flash memory

The characteristics are given at  $T_A = -40$  to  $105^\circ\text{C}$  unless otherwise specified.

**Table 28. Flash memory characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit
$t_{\text{prog}}$	Word programming time	$T_A = -40$ to $+105^\circ\text{C}$	40	52.5	70	$\mu\text{s}$
$t_{\text{ERASE}}$	Page (2 KB) erase time	$T_A = -40$ to $+105^\circ\text{C}$	20		40	ms
$t_{\text{ME}}$	Mass erase time	$T_A = -40$ to $+105^\circ\text{C}$	20		40	ms
$I_{\text{DD}}$	Supply current	Read mode $f_{\text{HCLK}} = 72 \text{ MHz}$ with 2 wait states, $V_{\text{DD}} = 3.3 \text{ V}$			28	mA
		Write mode $f_{\text{HCLK}} = 72 \text{ MHz}$ , $V_{\text{DD}} = 3.3 \text{ V}$			7	mA
		Erase mode $f_{\text{HCLK}} = 72 \text{ MHz}$ , $V_{\text{DD}} = 3.3 \text{ V}$			5	mA
		Power-down mode / Halt, $V_{\text{DD}} = 3.0$ to $3.6 \text{ V}$			50	$\mu\text{A}$
$V_{\text{prog}}$	Programming voltage		2		3.6	V

1. Values based on characterization and not tested in production.

**Table 29. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Value			Unit
			Min <sup>(1)</sup>	Typ	Max	
$N_{\text{END}}$	Endurance		TBD <sup>(2)</sup>			kcycles
$t_{\text{RET}}$	Data retention	$T_A = 85^\circ\text{C}$ , 1000 cycles	30			Years
		$T_A = 105^\circ\text{C}$ , 1000 cycles	10			

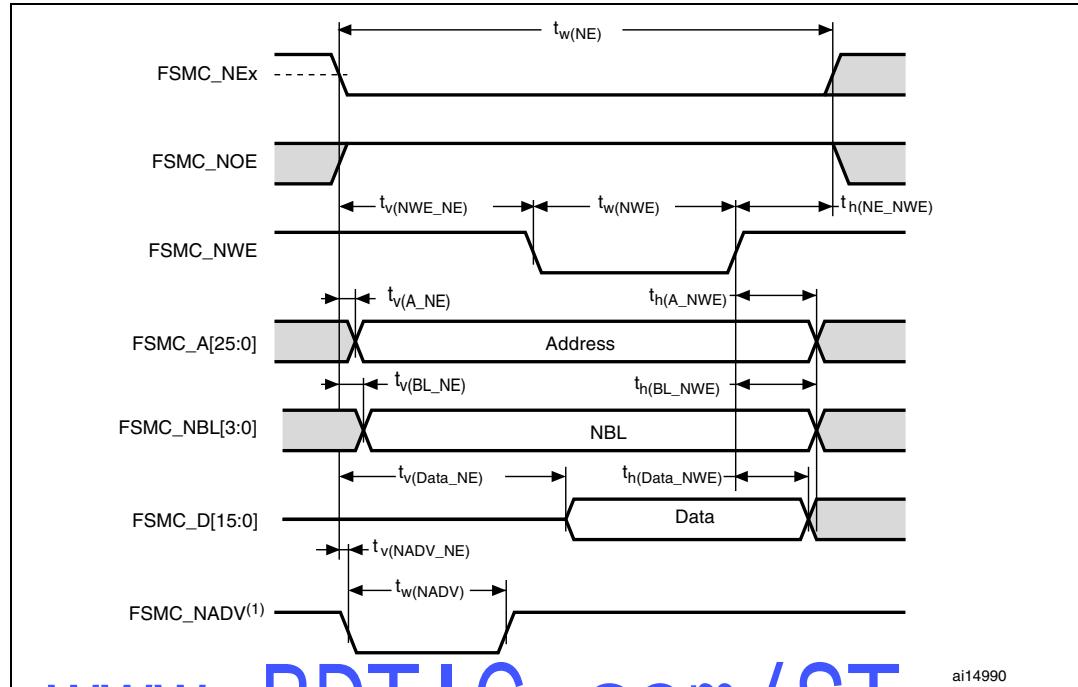

1. Values based on characterization not tested in production.

2. TBD = to be determined.

### 5.3.10 FSMC characteristics

All the timing characteristics are relative to the FSMC\_CLK signal for synchronous SRAM/NOR Flash memory accesses.

**Figure 22. Asynchronous non-multiplexed SRAM/NOR write timings**

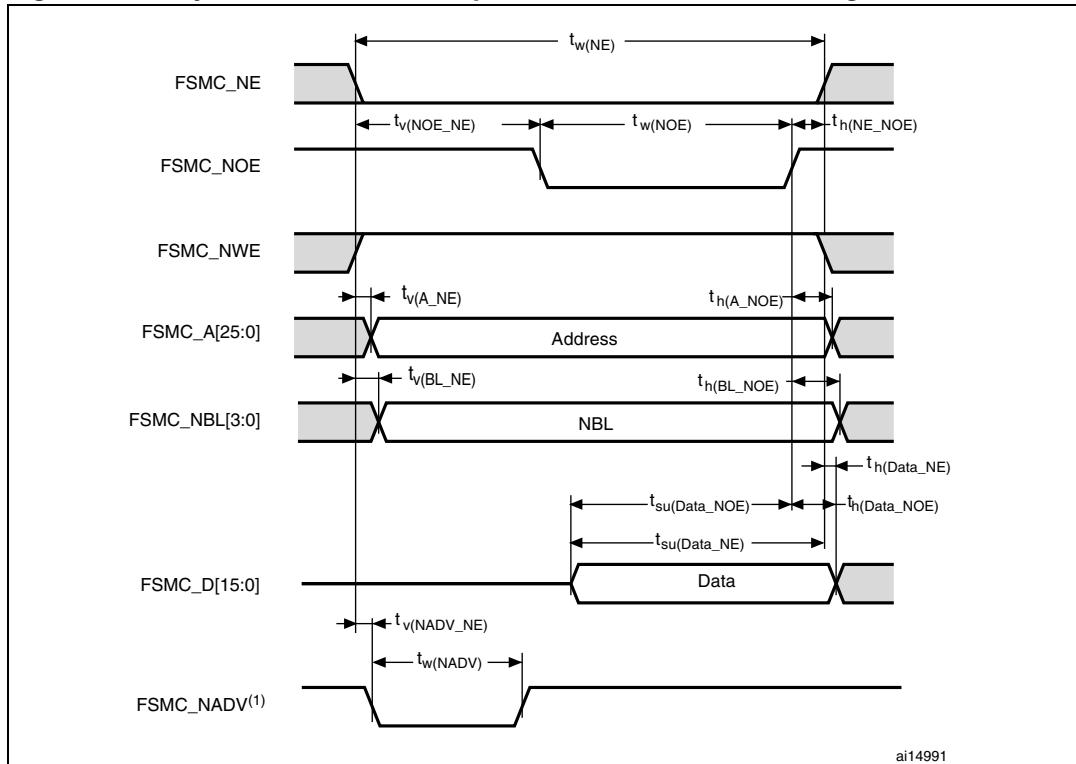

ai14990

1. Move P/B, Q and D only.

**Table 30. Asynchronous non-multiplexed SRAM/NOR write timings<sup>(1)</sup>**

$V_{DD\_IO} = V$ and $C_L = 15 \text{ pF}$				
Symbol	Parameter	Min	Max	Unit
$t_w(NE)$	FSMC_NE low time	TBD	TBD	$t_{CK}/\text{ns}$
$t_v(WEN\_NE)$	FSMC_NEx low to FSMC_NWE low	TBD	TBD	$t_{CK}/\text{ns}$
$t_w(NWE)$	FSMC_NWE low time	TBD	TBD	$t_{CK}/\text{ns}$
$t_h(NE\_NWE)$	FSMC_NWE high to FSMC_NE high hold time	TBD		$t_{CK}/\text{ns}$
$t_v(A\_NE)$	FSMC_NEx low to FSMC_A valid		TBD	ns
$t_h(A\_NWE)$	Address hold time after FSMC_NWE high	TBD		$t_{CK}/\text{ns}$

### 5.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 1000-4-2 standard.
- **FTB**: A Burst of Fast Transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 1000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 40](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 40. EMS characteristics**

Symbol	Parameter	Conditions	Level/ Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3 \text{ V}$ , $T_A = +25^\circ\text{C}$ , $f_{HCLK}=48 \text{ MHz}$ conforms to IEC 1000-4-2	2B
$V_{ENTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3 \text{ V}$ , $T_A = +25^\circ\text{C}$ , $f_{HCLK}=48 \text{ MHz}$ conforms to IEC 1000-4-4	4A

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with SAE J 1752/3 standard which specifies the test board and the pin loading.

**Table 41. EMI characteristics<sup>(1)</sup>**

<b>Symbol</b>	<b>Parameter</b>	<b>Conditions</b>	<b>Monitored frequency band</b>	<b>Max vs. [f<sub>HSE</sub>/f<sub>HCLK</sub>]</b>		<b>Unit</b>
				<b>8/48 MHz</b>	<b>8/72 MHz</b>	
$S_{\text{EMI}}$	Peak level	$V_{\text{DD}} = 3.3 \text{ V}$ , $T_A = 25^\circ\text{C}$ , LQFP100 package compliant with SAE J 1752/3	0.1 to 30 MHz	TBD	TBD	dB $\mu$ V
			30 to 130 MHz	TBD	TBD	
			130 MHz to 1GHz	TBD	TBD	
			SAE EMI Level	TBD	TBD	

1. TBD = to be determined.

### 5.3.12 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts  $\times$  (n+1 supply pins)). This test conforms to the JESD22-A114/C101 standard.

**Table 42. ESD absolute maximum ratings**

<b>Symbol</b>	<b>Ratings</b>	<b>Conditions</b>	<b>Class</b>	<b>Maximum value<sup>(1)</sup></b>	<b>Unit</b>
$V_{\text{ESD(HBM)}}$	Electrostatic discharge voltage (human body model)	$T_A = +25^\circ\text{C}$ conforming to JESD22-A114	II	2000	V
$V_{\text{ESD(CDM)}}$	Electrostatic discharge voltage (charge device model)	$T_A = +25^\circ\text{C}$ conforming to JESD22-C101			

1. Values based on characterization results, not tested in production.

#### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 43. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	$T_A = +105^\circ\text{C}$ conforming to JESD78A	II level A

### 5.3.13 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 44](#) are derived from tests performed under the conditions summarized in [Table 9](#). All I/Os are CMOS and TTL compliant.

**Table 44. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Input low level voltage <sup>(1)</sup>	TTL ports	-0.5		0.8	V
$V_{IH}$	Standard IO input high level voltage <sup>(1)</sup>		2		$V_{DD}+0.5$	
	IO FT <sup>(2)</sup> input high level voltage <sup>(1)</sup>		2		5.5V	
$V_{IL}$	Input low level voltage <sup>(1)</sup>	CMOS ports	-0.5		$0.35 V_{DD}$	V
$V_{IH}$	Input high level voltage <sup>(1)</sup>		$0.65 V_{DD}$		$V_{DD}+0.5$	
$V_{VHYS}$	Standard IO Schmitt trigger voltage hysteresis <sup>(3)</sup> IO FT Schmitt trigger voltage hysteresis <sup>(3)</sup>		200			mV
			$5\% V_{DD}$ <sup>(4)</sup>			mV
$I_{Ikg}$	Input leakage current <sup>(5)</sup>	$V_{SS} \leq V_{IN} \leq V_{DD}$ Standard I/Os			$\pm 1$	$\mu\text{A}$
		$V_{IN} = 5\text{ V}$ I/O FT			3	
$R_{PU}$	Weak pull-up equivalent resistor <sup>(6)</sup>	$V_{IN} = V_{SS}$	30	40	50	k $\Omega$
$R_{PD}$	Weak pull-down equivalent resistor <sup>(6)</sup>	$V_{IN} = V_{DD}$	30	40	50	k $\Omega$
$C_{IO}$	I/O pin capacitance			5		pF

1. Values based on characterization results, and not tested in production.
2. FT = Five-volt tolerant.
3. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested.
4. With a minimum of 100 mV.
5. Leakage could be higher than max. if negative current is injected on adjacent pins.
6. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

## Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to +/-8 mA, and sink +20 mA (with a relaxed  $V_{OL}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 5.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD}$  (see [Table 7](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $I_{VSS}$  (see [Table 7](#)).

## Output voltage levels

Unless otherwise specified, the parameters given in [Table 45](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#). All I/Os are CMOS and TTL compliant.

**Table 45. Output voltage characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	TTL port $I_{IO} = +8 \text{ mA}$ 2.7 V < $V_{DD}$ < 3.6 V		0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$		
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	CMOS port $I_{IO} = +8 \text{ mA}$ 2.7 V < $V_{DD}$ < 3.6 V		0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		2.4		
$V_{OL}^{(1)(3)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +20 \text{ mA}$ 2.7 V < $V_{DD}$ < 3.6 V		1.3	V
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-1.3$		
$V_{OL}^{(1)(3)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +6 \text{ mA}$ 2 V < $V_{DD}$ < 2.7 V		0.4	V
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$		

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 7](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
2. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 7](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .
3. Based on characterization data, not tested in production.

### Input/output AC characteristics

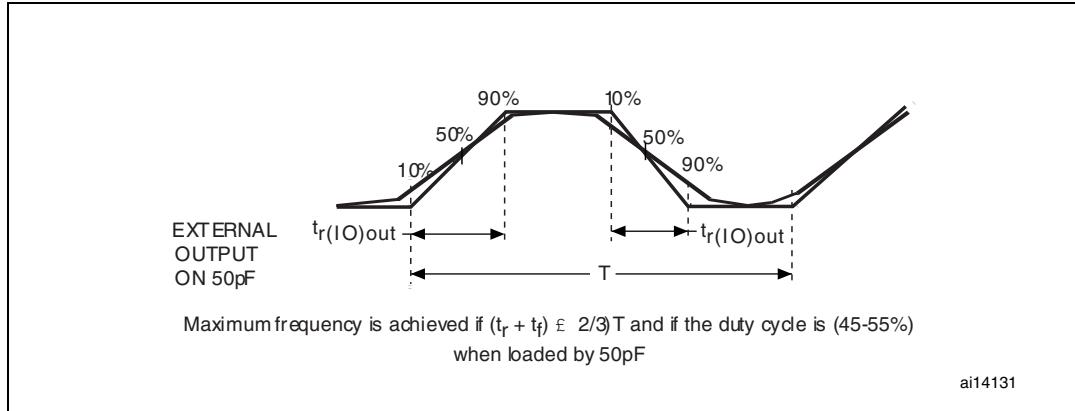

The definition and values of input/output AC characteristics are given in [Figure 40](#) and [Table 46](#), respectively.

Unless otherwise specified, the parameters given in [Table 46](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 46. I/O AC characteristics<sup>(1)</sup>**

MODEx[1:0] bit value <sup>(1)</sup>	Symbol	Parameter	Conditions	Min	Max	Unit
10	$f_{max(1O)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		2	MHz
	$t_f(1O)out$	Output high to low level fall time	$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		125 <sup>(3)</sup>	ns
	$t_r(1O)out$	Output low to high level rise time			125 <sup>(3)</sup>	
01	$f_{max(1O)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		10	MHz
	$t_f(1O)out$	Output high to low level fall time	$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		25 <sup>(3)</sup>	ns
	$t_r(1O)out$	Output low to high level rise time			25 <sup>(3)</sup>	
11	$F_{max(1O)out}$	Maximum frequency <sup>(2)</sup>	$C_L = 30 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		50	MHz
			$C_L = 50 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		30	MHz
			$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		20	MHz
	$t_f(1O)out$	Output high to low level fall time	$C_L = 30 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	ns
			$C_L = 50 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
	$t_r(1O)out$	Output low to high level rise time	$C_L = 30 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	ns
			$C_L = 50 \text{ pF}, V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}, V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
-	$t_{EXTIpw}$	Pulse width of external signals detected by the EXTI controller			10	ns

1. The I/O speed is configured using the MODEx[1:0] bits. Refer to the STM32F10xxx reference manual for a description of GPIO Port configuration register.
2. The maximum frequency is defined in [Figure 40](#).
3. Values based on design simulation and validated on silicon, not tested in production.

**Figure 40.** I/O AC characteristics definition

### 5.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 44](#)).

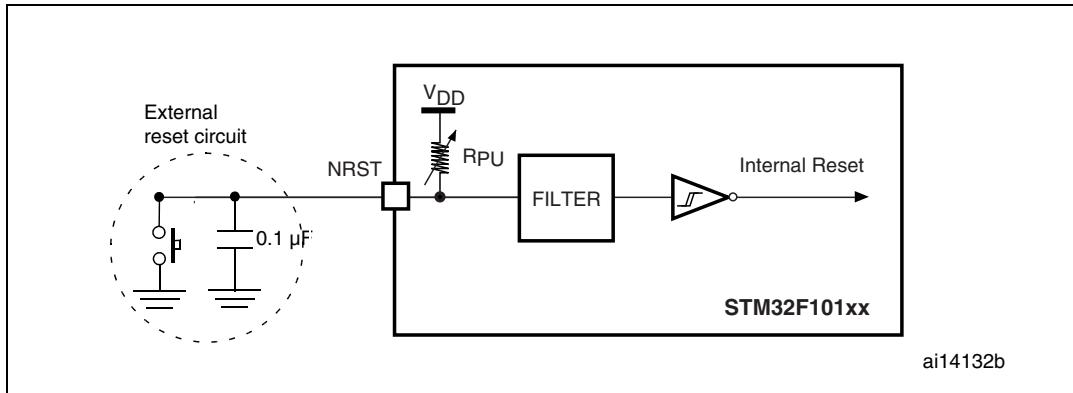

Unless otherwise specified, the parameters given in [Table 47](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 47.** NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST Input low level voltage		-0.5	0.8		V
$V_{IH(NRST)}$	NRST Input high level voltage		2		$V_{DD}+0.5$	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis			200		
$R_{PU}$	Weak pull-up equivalent resistor <sup>(1)</sup>	$V_{IN} = V_{SS}$	30	40	50	kΩ
$V_{F(NRST)}$	NRST Input filtered pulse <sup>(2)</sup>				100	ns
$V_{NF(NRST)}$	NRST Input not filtered pulse <sup>(2)</sup>		300			ns

1. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).
2. Values guaranteed by design, not tested in production.

Figure 41. Recommended NRST pin protection

5. The reset network protects the device against parasitic resets.
6. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 47](#). Otherwise the reset will not be taken into account by the device.

### 5.3.15 TIM timer characteristics

The parameters given in [Table 48](#) are guaranteed by fabrication.

Refer to [Section 5.3.13: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 48. TIMx<sup>(1)</sup> characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{RES(TIM)}$	Timer resolution time	$f_{TIMxCLK} = 72 \text{ MHz}$	1		$t_{TIMxCLK}$
			13.9		ns
$f_{EXT}$	Timer external clock frequency on CH1 to CH4	$f_{TIMxCLK} = 72 \text{ MHz}$	0	$f_{TIMxCLK}/2$	MHz
			0	36	MHz
$Res_{TIM}$	Timer resolution			16	bit
$t_{COUNTER}$	16-bit counter clock period when internal clock is selected	$f_{TIMxCLK} = 72 \text{ MHz}$	1	65536	$t_{TIMxCLK}$
			0.0139	910	μs
$t_{MAX\_COUNT}$	Maximum possible count	$f_{TIMxCLK} = 72 \text{ MHz}$		$65536 \times 65536$	$t_{TIMxCLK}$
				59.6	s

1. TIMx is used as a general term to refer to the TIM1, TIM2, TIM3 and TIM4 timers.

### 5.3.16 Communications interfaces

#### I<sup>2</sup>C interface characteristics

Unless otherwise specified, the parameters given in [Table 49](#) are derived from tests performed under ambient temperature,  $f_{PCLK1}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

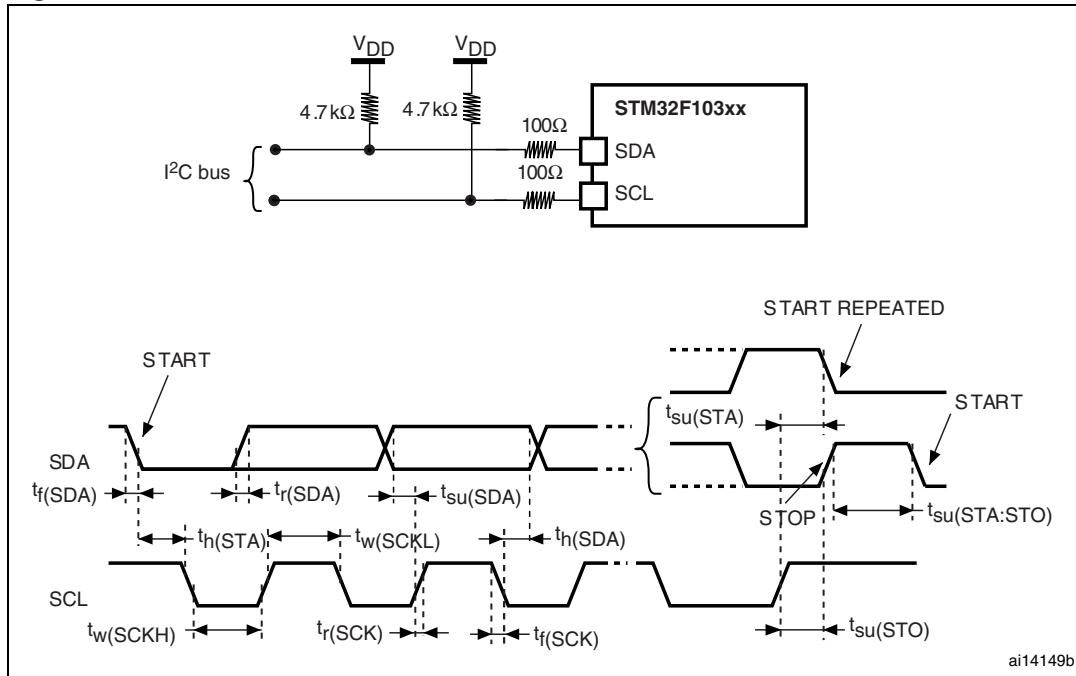

The STM32F103xC performance line I<sup>2</sup>C interface meets the requirements of the standard I<sup>2</sup>C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and  $V_{DD}$  is disabled, but is still present.

The I<sup>2</sup>C characteristics are described in [Table 49](#). Refer also to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (SDA and SCL).

**Table 49. I<sup>2</sup>C characteristics**

Symbol	Parameter	Standard mode I <sup>2</sup> C <sup>(1)</sup>		Fast mode I <sup>2</sup> C <sup>(1)(2)</sup>		Unit
		Min	Max	Min	Max	
$t_w(SCL)$	SCL clock low time	4.7		1.3		$\mu\text{s}$
$t_w(SCLH)$	SCL clock high time	4.0		0.6		
$t_{su}(SDA)$	SDA setup time	250		100		$\text{ns}$
$t_h(SDA)$	SDA data hold time	0 <sup>(3)</sup>		0 <sup>(4)</sup>	900 <sup>(3)</sup>	
$t_r(SDA)$ $t_r(SCL)$	SDA and SCL rise time		1000	20 + 0.1C <sub>b</sub>	300	$\text{ns}$
$t_f(SDA)$ $t_f(SCL)$	SDA and SCL fall time		300	20 + 0.1C <sub>b</sub>	300	
$t_h(STA)$	Start condition hold time	4.0		0.6		$\mu\text{s}$
$t_{su}(STA)$	Repeated Start condition setup time	4.7		0.6		
$t_{su}(STO)$	Stop condition setup time	4.0		0.6		$\mu\text{s}$
$t_w(STO:STA)$	Stop to Start condition time (bus free)	4.7		1.3		$\mu\text{s}$
$C_b$	Capacitive load for each bus line		400		400	pF

- Values based on standard I<sup>2</sup>C protocol requirement, not tested in production.
- $f_{PCLK1}$  must be higher than 2 MHz to achieve the maximum standard mode I<sup>2</sup>C frequency. It must be higher than 4 MHz to achieve the maximum fast mode I<sup>2</sup>C frequency.
- The maximum hold time of the Start condition has only to be met if the interface does not stretch the low period of SCL signal.
- The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

**Figure 42.** I<sup>2</sup>C bus AC waveforms and measurement circuit

1. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

**Table 50.** SCL frequency ( $f_{PCLK1} = 36$  MHz.,  $V_{DD} = 3.3$  V)<sup>(1)(2)(3)</sup>

$f_{SCL}$ (kHz)	I <sup>2</sup> C CCR value	
	$R_P = 4.7\text{ k}\Omega$	
400	TBD	
300	TBD	
200	TBD	
100	TBD	
50	TBD	
20	TBD	

1. TBD = to be determined.  
 2.  $R_P$  = External pull-up resistance,  $f_{SCL}$  = I<sup>2</sup>C speed,  
 3. For speeds around 200 kHz, the tolerance on the achieved speed is of  $\pm 5\%$ . For other speed ranges, the tolerance on the achieved speed  $\pm 2\%$ . These variations depend on the accuracy of the external components used to design the application.

## I<sup>2</sup>S - SPI characteristics

Unless otherwise specified, the parameters given in [Table 51](#) for SPI or in [Table 52](#) for I<sup>2</sup>S are derived from tests performed under ambient temperature, f<sub>PCLKx</sub> frequency and V<sub>DD</sub> supply voltage conditions summarized in [Table 9](#).

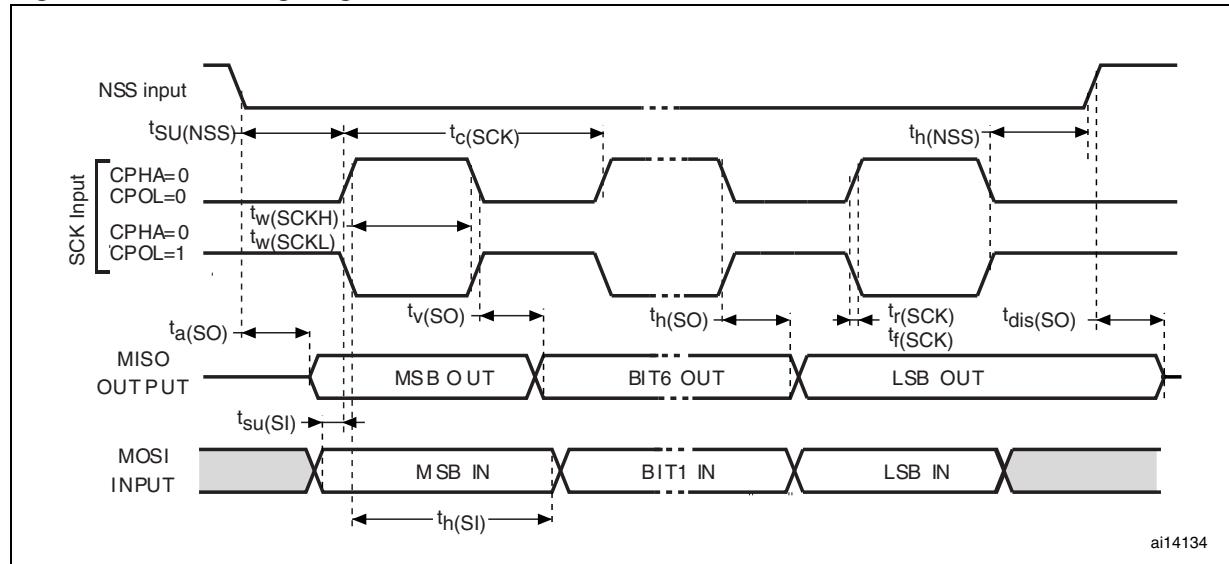

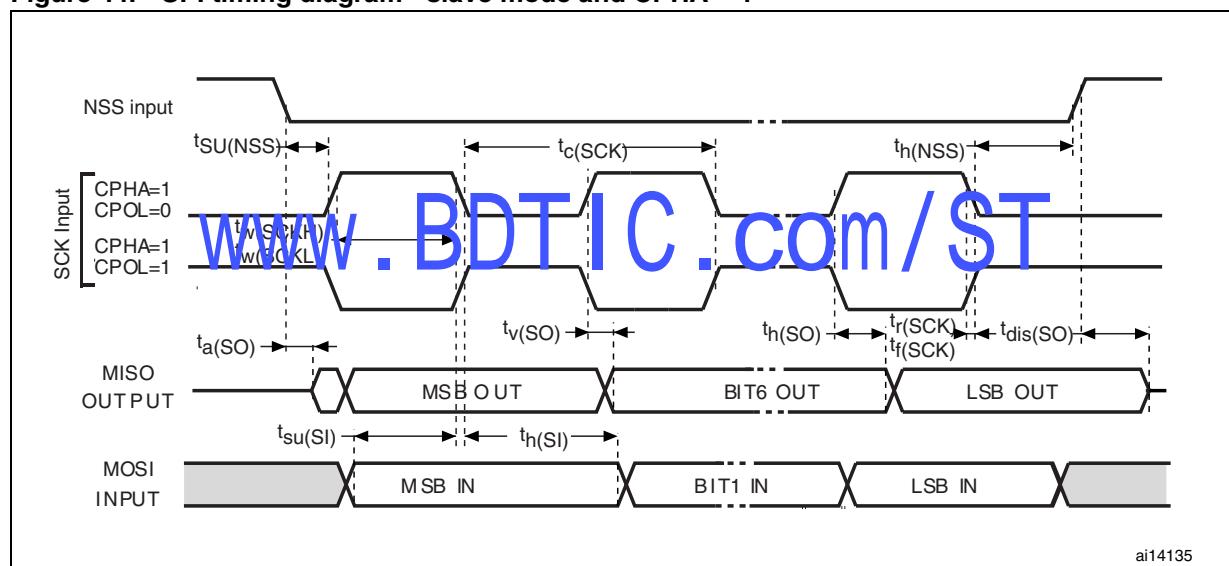

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I<sup>2</sup>S).

**Table 51. SPI characteristics<sup>(1)</sup> (2)**

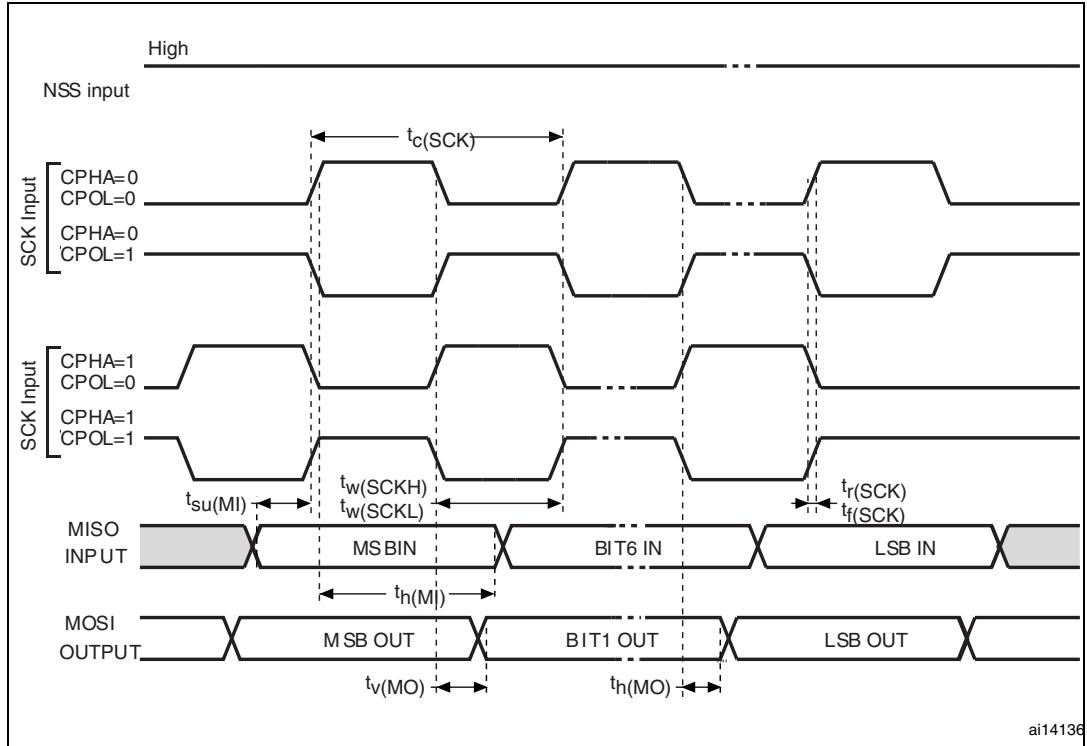

Symbol	Parameter	Conditions	Min	Max	Unit
f <sub>SCK</sub> 1/t <sub>c(SCK)</sub>	SPI clock frequency	Master mode	0	18	MHz
t <sub>r(SCK)</sub> t <sub>f(SCK)</sub>		Slave mode	0	18	
t <sub>su(NSS)</sub> <sup>(3)</sup>	SPI clock rise and fall time	Capacitive load: C = 30 pF		8	
t <sub>h(NSS)</sub> <sup>(3)</sup>					
t <sub>w(SCKH)</sub> <sup>(3)</sup> t <sub>w(SCKL)</sub> <sup>(3)</sup>	SCK high and low time	Master mode, f <sub>PCLK</sub> = 36 MHz, presc = 4	50	60	
t <sub>su(MI)</sub> <sup>(3)</sup> t <sub>su(SI)</sub> <sup>(3)</sup>	Data input setup time	Master mode	10		
		Slave mode	5		
t <sub>h(MI)</sub> <sup>(3)</sup> t <sub>h(SI)</sub> <sup>(3)</sup>	Data input hold time	Master mode, f <sub>PCLK</sub> = 36 MHz, presc = 4	15		ns
		Slave mode, f <sub>PCLK</sub> = 36 MHz, presc = 4	5		
		Master mode, f <sub>PCLK</sub> = TBD	TBD <sup>(4)</sup>		
		Slave mode, f <sub>PCLK</sub> = TBD	TBD <sup>(4)</sup>		
t <sub>a(SO)</sub> <sup>(3)(5)</sup>	Data output access time	Slave mode, f <sub>PCLK</sub> = 36 MHz, presc = 4	0	60	
		Slave mode, f <sub>PCLK</sub> = TBD	0	TBD	
t <sub>dis(SO)</sub> <sup>(3)(6)</sup>	Data output disable time	Slave mode	5	TBD	
t <sub>v(SO)</sub> <sup>(3)(1)</sup>	Data output valid time	Slave mode (after enable edge), f <sub>PCLK</sub> = 36 MHz, presc = 4		30	
		f <sub>PCLK</sub> = TBD			
t <sub>v(MO)</sub> <sup>(3)(1)</sup>	Data output valid time	Master mode (after enable edge), f <sub>PCLK</sub> = 36 MHz, presc = 4		10	
		f <sub>PCLK</sub> = TBD			
t <sub>h(SO)</sub> <sup>(3)</sup> t <sub>h(MO)</sub> <sup>(3)</sup>	Data output hold time	Slave mode (after enable edge)	30		
		Master mode (after enable edge)	10		

1. TBD = to be determined.
2. Remapped SPI1 characteristics to be determined.
3. Values based on design simulation and/or characterization results, and not tested in production.
4. Depends on f<sub>PCLK</sub>. For example, if f<sub>PCLK</sub>= 8MHz, then t<sub>PCLK</sub> = 1/f<sub>PCLK</sub> = 125 ns and t<sub>v(MO)</sub> = 255 ns.
5. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
6. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z

### SD/SDIO MMC card host interface (SDIO) characteristics

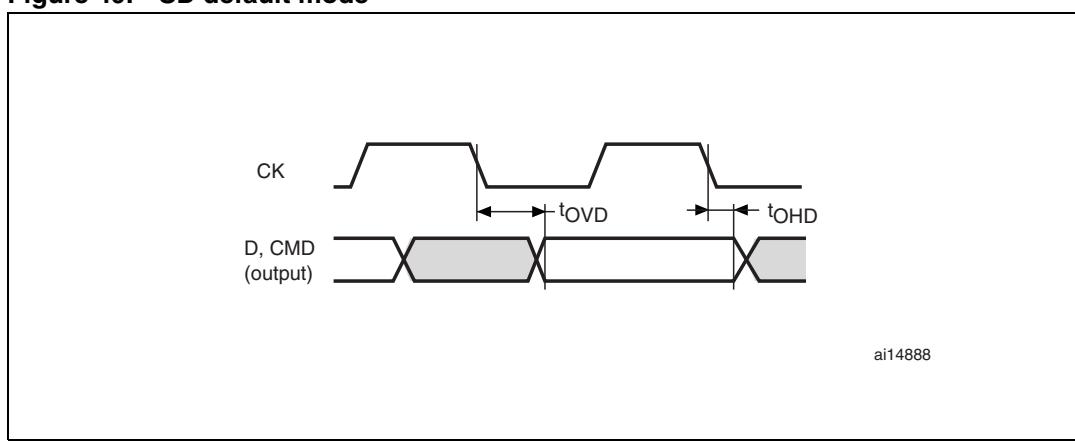

Unless otherwise specified, the parameters given in [Table 53](#) are derived from tests performed under ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (D[7:0], CMD, CK).

**Figure 48. SDIO high-speed mode**

**Figure 49. SD default mode**

**Table 53. SD / MMC characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{PP}$	Clock frequency in data transfer mode	$C_L \leq 30 \text{ pF}$	0	TBD	MHz
$t_{W(CKL)}$	Clock low time	$C_L \leq 30 \text{ pF}$	TBD		ns
$t_{W(CKH)}$	Clock high time	$C_L \leq 30 \text{ pF}$	TBD		
$t_r$	Clock rise time	$C_L \leq 30 \text{ pF}$		TBD	
$t_f$	Clock fall time	$C_L \leq 30 \text{ pF}$		TBD	
$t_C$					
<b>CMD, D inputs (referenced to CK)</b>					
$t_{ISU}$	Input setup time	$C_L \leq 30 \text{ pF}$	TBD		ns
$t_{IH}$	Input hold time	$C_L \leq 30 \text{ pF}$	TBD		
<b>CMD, D outputs (referenced to CK) in MMC and SD HS mode</b>

$t_{OH}$	Output hold time	$C_L \leq 30 \text{ pF}$	TBD		
<b>CMD, D outputs (referenced to CK) in SD default mode<sup>(1)</sup></b>					
$t_{OVD}$	Output valid default time	$C_L \leq 30 \text{ pF}$		TBD	ns
$t_{OHD}$	Output hold default time	$C_L \leq 30 \text{ pF}$	TBD		

1. Refer to SS1C\_CLKCR, the SDI clock control register to control the CK output.

### USB characteristics

The USB interface is USB-IF certified (Full Speed).

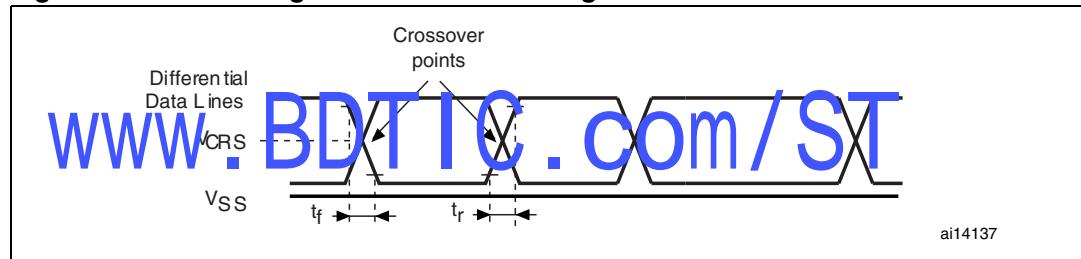

**Table 54. USB startup time**

Symbol	Parameter	Max	Unit
$t_{STARTUP}$	USB transceiver startup time	1	$\mu\text{s}$

**Table 55. USB DC electrical characteristics**

Symbol	Parameter	Conditions	Min. <sup>(1)</sup>	Max. <sup>(1)</sup>	Unit
<b>Input levels</b>					
$V_{USB}$	USB voltage <sup>(2)</sup>	Within $V_{DD}$ voltage range	3.0 <sup>(3)</sup>	3.6	V
$V_{DI}^{(4)}$	Differential input sensitivity	I(USBDP, USBDM)	0.2		
$V_{CM}^{(4)}$	Differential common mode range	Includes $V_{DI}$ range	0.8	2.5	V
$V_{SE}^{(4)}$	Single ended receiver threshold		1.3	2.0	
<b>Output levels</b>					
$V_{OL}$	Static output level low	$R_L$ of 1.5 kΩ to 3.6 V <sup>(5)</sup>		0.3	V
$V_{OH}$	Static output level high	$R_L$ of 15 kΩ to $V_{SS}^{(5)}$	2.8	3.6	

1. All the voltages are measured from the local ground potential.
2. To be compliant with the USB 2.0 full-speed electrical specification, the USBDP (D+) pin should be pulled up with a 1.5 kΩ resistor to a 3.0-to-3.6 V voltage range.
3. The STM32F103xx USB functionality is ensured down to 2.7 V but not the full USB electrical characteristics which are degraded in the 2.7-to-3.0 V  $V_{DD}$  voltage range.
4. Guaranteed by characterization, not tested in production.
5.  $R_L$  is the load connected on the USB drivers

**Figure 50. USB timings: definition of data signal rise and fall time****Table 56. USB: full-speed electrical characteristics**

Driver characteristics <sup>(1)</sup>					
Symbol	Parameter	Conditions	Min	Max	Unit
$t_r$	Rise time <sup>(2)</sup>	$C_L = 50$ pF	4	20	ns
$t_f$	Fall Time <sup>(2)</sup>	$C_L = 50$ pF	4	20	ns
$t_{rfm}$	Rise/ fall time matching	$t_r/t_f$	90	110	%
$V_{CRS}$	Output signal crossover voltage		1.3	2.0	V

1. Guaranteed by characterization, not tested in production.
2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).

### 5.3.17 CAN (controller area network) interface

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CANTX and CANRX).

### 5.3.18 12-bit ADC characteristics

Unless otherwise specified, the parameters given in [Table 57](#) are derived from tests performed under ambient temperature,  $f_{PCLK2}$  frequency and  $V_{DDA}$  supply voltage conditions summarized in [Table 9](#).

*Note:* *It is recommended to perform a calibration after each power-up.*

**Table 57. ADC characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	ADC power supply		2.4		3.6	V
$V_{REF+}$	Positive reference voltage		2.4		$V_{DDA}$	V
$f_{ADC}$	ADC clock frequency		0.6		14	MHz
$f_S^{(1)}$	Sampling rate		0.05		1	MHz
$f_{TRIG}^{(1)}$	External trigger frequency	$f_{ADC} = 14$ MHz		823	kHz	$1/f_{ADC}$
				17		
$V_{AIN}$	Conversion voltage range <sup>(2)</sup>		0 ( $V_{SSA}$ or $V_{REF-}$ tied to ground)		$V_{REF+}$	V
$R_{AIN}^{(1)}$	External input impedance		See <a href="#">Equation 1</a> and <a href="#">Table 58</a>			kΩ
$R_{ADC}^{(1)}$	Sampling switch resistance				1	kΩ
$C_{ADC}^{(1)}$	Internal sample and hold capacitor				5	pF
$t_{CAL}^{(1)}$	Calibration time	$f_{ADC} = 14$ MHz	5.9 83			μs $1/f_{ADC}$
$t_{lat}^{(1)}$	Injection trigger conversion latency	$f_{ADC} = 14$ MHz		0.214 3 <sup>(3)</sup>	0.214	μs
					3 <sup>(3)</sup>	$1/f_{ADC}$
$t_{latr}^{(1)}$	Regular trigger conversion latency	$f_{ADC} = 14$ MHz		0.143 2 <sup>(3)</sup>	0.143	μs
					2 <sup>(3)</sup>	$1/f_{ADC}$
$t_S^{(1)}$	Sampling time	$f_{ADC} = 14$ MHz	0.107		17.1	μs
			1.5		239.5	$1/f_{ADC}$
$t_{STAB}^{(1)}$	Power-up time		0	0	1	μs
$t_{CONV}^{(1)}$	Total conversion time (including sampling time)	$f_{ADC} = 14$ MHz	1		18	μs
			14 to 252 ( $t_S$ for sampling +12.5 for successive approximation)			$1/f_{ADC}$

1. Guaranteed by design, not tested in production.

2.  $V_{REF+}$  can be internally connected to  $V_{DDA}$  and  $V_{REF-}$  can be internally connected to  $V_{SSA}$ , depending on the package. Refer to [Section 3: Pin descriptions](#) for further details.

3. For external triggers, a delay of  $1/f_{PCLK2}$  must be added to the latency specified in [Table 57](#).

**Equation 1:  $R_{AIN}$  max formula:**

$$R_{AIN} < \frac{T_S}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above ([Equation 1](#)) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

**Table 58.**  $R_{AIN}$  max for  $f_{ADC} = 14$  MHz<sup>(1)</sup>

$T_S$ (cycles)	$t_S$ (μs)	$R_{AIN}$ max (kΩ)
1.5	0.11	1.2
7.5	0.54	10
13.5	0.96	19
28.5	2.04	41
41.5	2.96	60
55.5	3.96	80
71.5	5.11	104
239.5	17.1	350

1. Data guaranteed by design, not tested in production.

**Table 59.** ADC accuracy - limited test conditions<sup>(1)</sup>

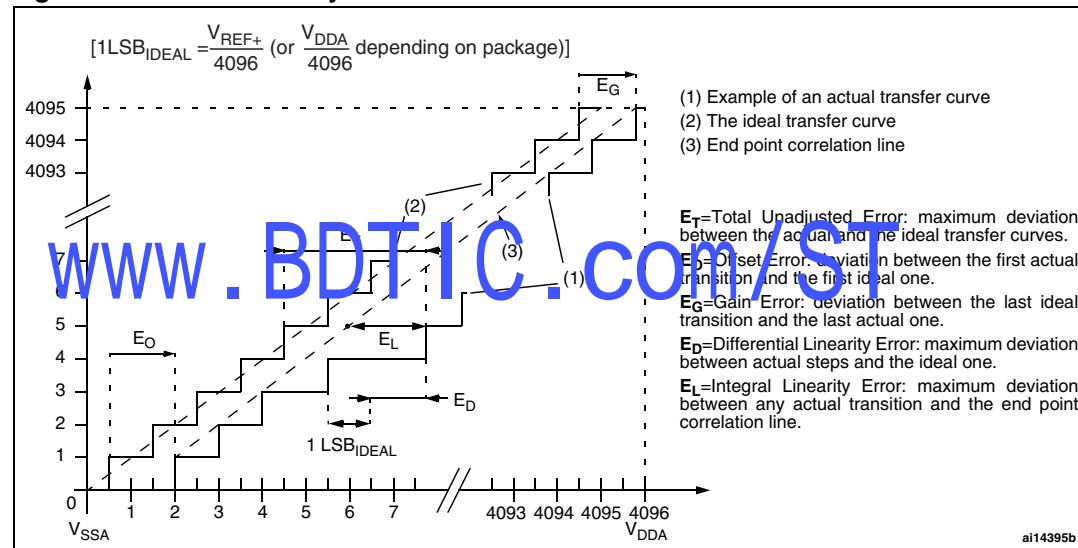

Symbol	Parameter	Test conditions	Typ	Max <sup>(2)</sup>	Unit
ET	Total unadjusted error <sup>(3)</sup>	$f_{ADC} = 14$ MHz, $R_{AIN} < 10$ kΩ, $V_{DDA} = 3$ V to 3.6 V, $T_A = 25$ °C	±1.3	±2	LSB
EO	Offset error <sup>(3)</sup>		±1	±1.5	
EG	Gain error <sup>(3)</sup>		±0.5	±1.5	
ED	Differential linearity error <sup>(3)</sup>		±0.7	±1	
EL	Integral linearity error <sup>(3)</sup>		±0.8	±1.5	

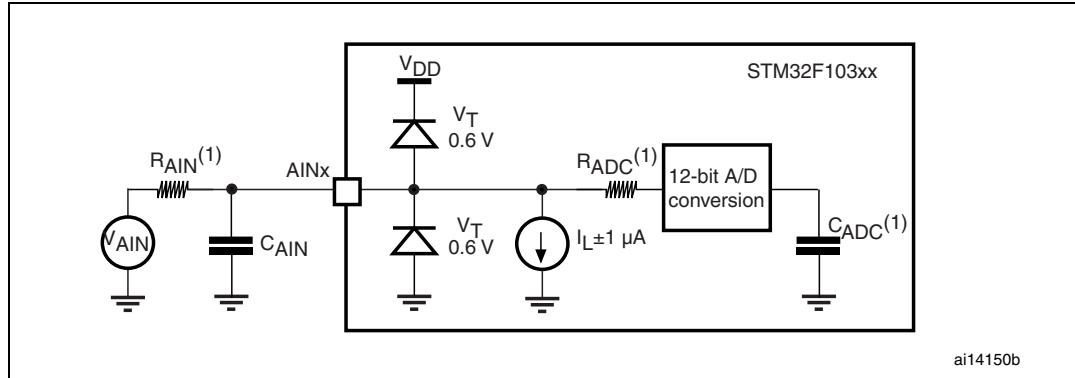

1. ADC DC accuracy values are measured after internal calibration.
2. Data based on characterization, not tested in production.
3. ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current.  
Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 5.3.13](#) does not affect the ADC accuracy.

**Table 60. ADC accuracy<sup>(1) (2)</sup>**

Symbol	Parameter	Test conditions	Typ	Max <sup>(3)</sup>	Unit
ET	Total unadjusted error <sup>(4)</sup>	$f_{PCLK2} = 56 \text{ MHz}$ , $f_{ADC} = 14 \text{ MHz}$ , $R_{AIN} < 10 \text{ k}\Omega$ , $V_{DDA} = 2.4 \text{ V to } 3.6 \text{ V}$ Measurements made after ADC calibration	$\pm 2$	$\pm 5$	LSB
EO	Offset error <sup>(3)</sup>		$\pm 1.5$	$\pm 25$	
EG	Gain error <sup>(3)</sup>		$\pm 1.5$	$\pm 3$	
ED	Differential linearity error <sup>(3)</sup>		$\pm 1$	$\pm 2$	
EL	Integral linearity error <sup>(3)</sup>		$\pm 1.5$	$\pm 3$	

1. ADC DC accuracy values are measured after internal calibration.
2. Better performance could be achieved in restricted  $V_{DD}$ , frequency,  $V_{REF}$  and temperature ranges.
3. Data based on characterization, not tested in production.
4. ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current.  
Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 5.3.13](#) does not affect the ADC accuracy.

**Figure 51. ADC accuracy characteristics**

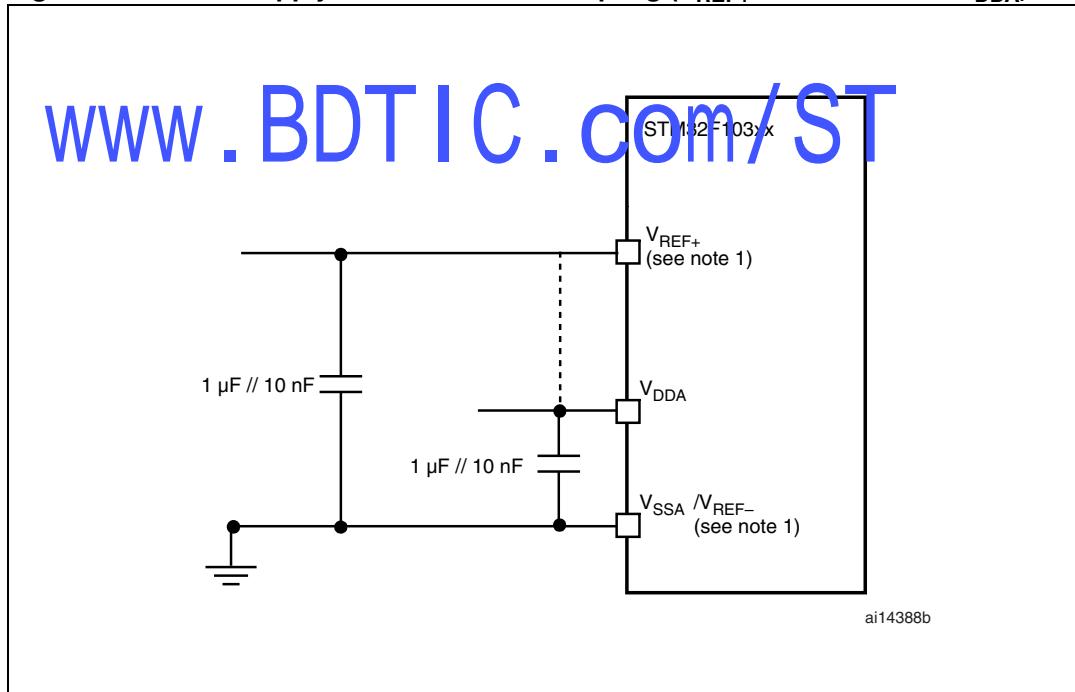

**Figure 52.** Typical connection diagram using the ADC

ai14150b

1. Refer to [Table 57](#) for the values of  $C_{AIN}$ ,  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
2.  $C_{PARASITIC}$  must be added to  $C_{AIN}$ . It represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (3 pF). A high  $C_{PARASITIC}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

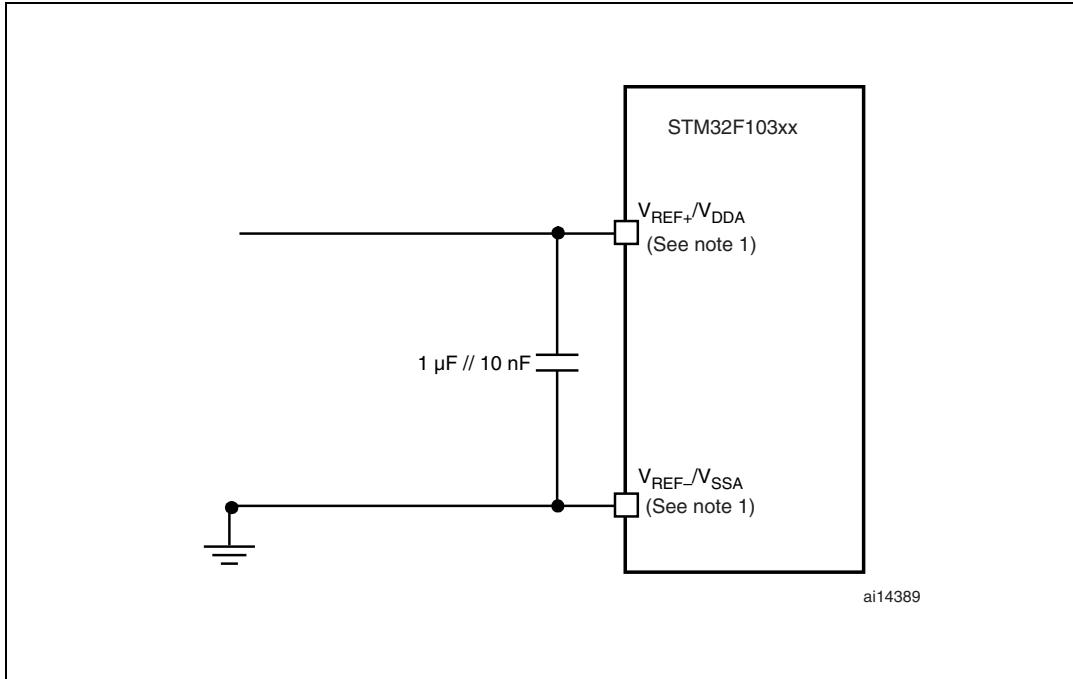

### General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 53](#) or [Figure 54](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. The 10 nF capacitors should be ceramic (good quality). They should be placed them as close as possible to the chip.

**Figure 53.** Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )

ai14388b

1.  $V_{REF+}$  and  $V_{REF-}$  inputs are available only on 100-pin packages.

**Figure 54. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  and  $V_{REF-}$  inputs are available only on 100-pin packages.

### 5.3.19 DAC electrical specifications

**Table 61. DAC characteristics**

Symbol	Parameter	Min	Typ	Max <sup>(1)</sup>	Unit	Comments
$V_{DD33A}$	Analog supply voltage	2.4		3.6	V	
$V_{DD18D}$	Digital supply voltage	1.6	1.8	2	V	
$V_{REF+}$	Reference supply voltage	2.4		3.6	V	$V_{REF+}$ must always be below $V_{DD33A}$
$V_{SSA}$	Ground	0		0	V	
$R_L$	Resistive load with buffer ON	5			kΩ	Minimum resistive load between DAC_OUT and $V_{SSA}$
$C_L$	Capacitive load			50	pF	Maximum capacitive load at DAC_OUT pin.
DAC_OUT min	Lower DAC_OUT voltage with buffer ON	0.2			V	It gives the maximum output excursion of the DAC
DAC_OUT max	Higher DAC_OUT voltage with buffer ON			$V_{REF+} - 0.2$ V	V	it corresponds to 12-bit input code (0E0)h to (F1C)h @ $V_{REF+} = 3.6$ V and (155)h and (EAB)h @ $V_{REF+} = 2.4$ V
$I_{DD}$	DAC DC current consumption in quiescent mode (Standby mode) (in $V_{DD18D} + V_{DD33A} + V_{REF+}$ )		425	600	μA	With no load, middle code (800)H on the inputs
			500	700	μA	With no load, worst code (F1C)H @ $V_{REF+} = 3.6$ V in terms of DC consumption on the inputs
$I_{DDQ}$	DAC DC current consumption in Power Down mode (in $V_{DD18D} + V_{DD33A} + V_{REF+}$ )		5	350	nA	With no load.
	DAC DC current consumption in Power Down mode (in $V_{DD33A} + V_{REF+}$ )		5	200		
DNL	Differential non linearity (Difference between two consecutive code-1LSB)		±0.5		LSB	Given for the DAC in 10-bit configuration (B1=B0=0 always)
INL	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023)		±1		LSB	Given for the DAC in 10-bit configuration (B1=B0=0 always)
Offset	Offset error (difference between measured value at Code (800)H and the ideal value = $V_{REF+}/2$ )		±10		mV	Given for the DAC in 10-bit configuration (B1=B0=0 always)
			±3		LSB	Given for the DAC in 10-bit @ $V_{REF+} = 3.6$ V
Gain error	Gain error		±0.5		%	Given for the DAC in 10-bit configuration (B1=B0=0 always)

**Table 61.** DAC characteristics (continued)

Symbol	Parameter	Min	Typ	Max <sup>(1)</sup>	Unit	Comments
Amplifier gain	Gain of the amplifier in open loop	80	85		dB	with a 5 kΩ load (worst case)
tSETTLING	Settling time (full scale: for an 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value ±1LSB)		3	4	μs	C <sub>LOAD</sub> ≤ 50 pF, R <sub>LOAD</sub> ≥ 5 kΩ
Update rate	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)			1	MS/s	C <sub>LOAD</sub> ≤ 50 pF, R <sub>LOAD</sub> ≥ 5 kΩ
tWAKEUP	Wakeup time from off state (PDV18 from 1 to 0)		6.5	10	μs	C <sub>LOAD</sub> ≤ 50 pF, R <sub>LOAD</sub> ≥ 5 kΩ input code between lowest and highest possible ones.
PSRR+	Power supply rejection ratio (to V <sub>DD33A</sub> ) (static DC measurement)		-67	-40	dB	No R <sub>LOAD</sub> , C <sub>LOAD</sub> = 50 pF

1. Guaranteed by characterization, not tested in production.

### 5.3.20 Temperature sensor characteristics

**Table 62.** TS characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T <sub>L</sub> <sup>(1)</sup>	V <sub>SENSE</sub> linearity with temperature			±1	±2	°C
Avg_Slope <sup>(1)</sup>	Average slope		4.0	4.3	4.6	mV/°C
V <sub>25</sub> <sup>(1)</sup>	Voltage at 25 °C		1.34	1.43	1.52	V
t <sub>START</sub> <sup>(2)</sup>	Startup time		4		10	μs
T <sub>S_temp</sub> <sup>(3)(2)</sup>	ADC sampling time when reading the temperature			2.2	17.1	μs

1. Guaranteed by characterization, not tested in production.

2. Data guaranteed by design, not tested in production.

3. Shortest sampling time can be determined in the application by multiple iterations.

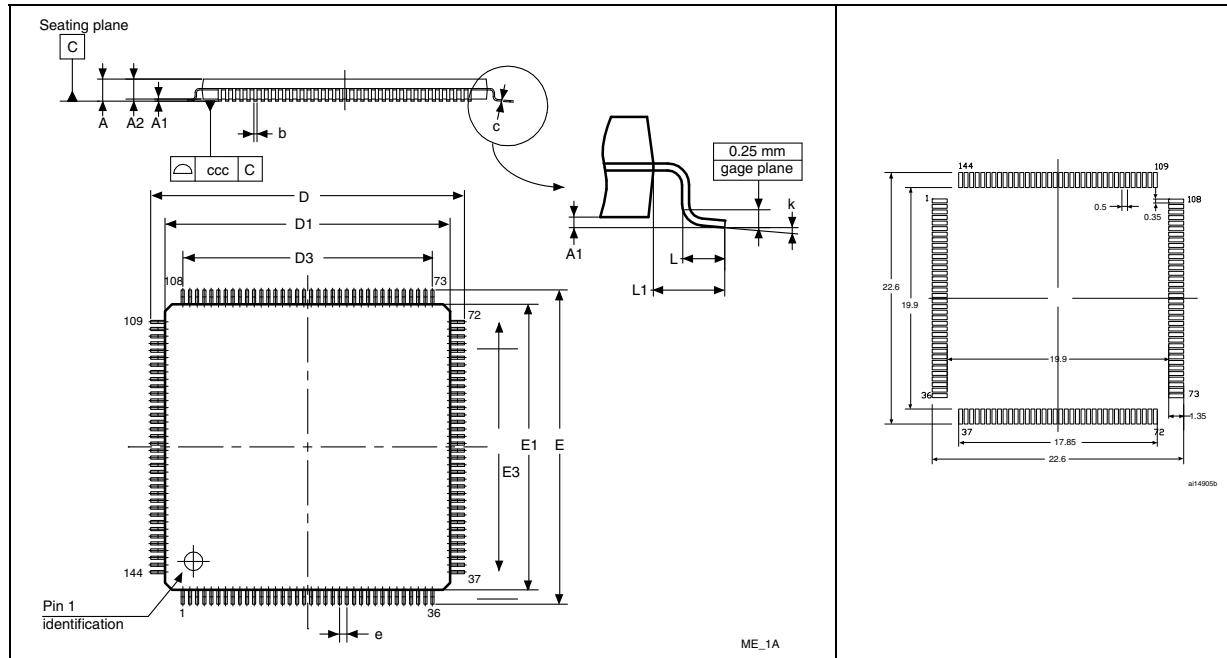

## 6 Package characteristics

### 6.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second-level interconnect. The category of second-level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97.

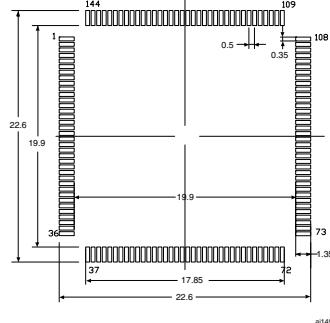

The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).

[www.BDTIC.com/ST](http://www.BDTIC.com/ST)

## 6.2 Thermal characteristics

The maximum chip junction temperature ( $T_J\max$ ) must never exceed the values given in [Table 9: General operating conditions on page 38](#).

The maximum chip-junction temperature,  $T_J\max$ , in degrees Celsius, may be calculated using the following equation:

$$T_J\max = T_A\max + (P_D\max \times \Theta_{JA})$$

Where:

- $T_A\max$  is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D\max$  is the sum of  $P_{INT}\max$  and  $P_{I/O}\max$  ( $P_D\max = P_{INT}\max + P_{I/O}\max$ ),
- $P_{INT}\max$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O}\max$  represents the maximum power dissipation on output pins where:

$$P_{I/O}\max = \sum (V_{OL} \times I_{OL}) + \sum ((V_{OH} - V_{OL}) \times I_{OH}),$$

taking into account the actual  $V_{OL}$  /  $I_{OL}$  and  $V_{OH}$  /  $I_{OH}$  of the I/Os at low and high level in the application.

**Table 68. Thermal characteristics**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient LFBGA144 - 10 × 10 mm / 0.5 mm pitch	TBD	°C/W
	Thermal resistance junction-ambient LQFP144 - 21 × 20 mm / 0.5 mm pitch	TBD	
	Thermal resistance junction-ambient LFBGA100 - 10 × 10 mm / 0.5 mm pitch	41	
	Thermal resistance junction-ambient LQFP100 - 14 × 14 mm / 0.5 mm pitch	46	
	Thermal resistance junction-ambient LQFP64 - 10 × 10 mm / 0.5 mm pitch	45

## 6.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Table 69: Ordering information scheme](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F103xC at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

### Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature  $T_{A\max} = 82^\circ\text{C}$  (measured according to JESD51-2),  $I_{DD\max} = 50 \text{ mA}$ ,  $V_{DD} = 3.5 \text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8 \text{ mA}$ ,  $V_{OL} = 0.4 \text{ V}$  and maximum 8 I/Os used at the same time in output at low level with  $I_{OL} = 20 \text{ mA}$ ,  $V_{OL} = 1.3 \text{ V}$

$$P_{INT\max} = 50 \text{ mA} \times 3.5 \text{ V} = 175 \text{ mW}$$

$$P_{IO\max} = 20 \times 8 \text{ mA} \times 0.4 \text{ V} + 8 \times 20 \text{ mA} \times 1.3 \text{ V} = 272 \text{ mW}$$

This gives:  $P_{INT\max} = 175 \text{ mW}$  and  $P_{IO\max} = 272 \text{ mW}$ :

$$P_{D\max} = 175 + 272 = 447 \text{ mW}$$

Thus:  $P_{D\max} = 464 \text{ mW}$

Using the values obtained in [Table 69](#),  $T_{J\max}$  is calculated as follows:

— For LQFP100, 46 °C/W

$$T_{J\max} = 82^\circ\text{C} + (46^\circ\text{C/W} \times 447 \text{ mW}) = 82^\circ\text{C} + 20.6^\circ\text{C} = 102.6^\circ\text{C}$$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105^\circ\text{C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 6 (see [Table 69: Ordering information scheme](#)).

### Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature  $T_{A\max} = 115^\circ\text{C}$  (measured according to JESD51-2),  $I_{DD\max} = 20 \text{ mA}$ ,  $V_{DD} = 3.5 \text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8 \text{ mA}$ ,  $V_{OL} = 0.4 \text{ V}$

$$P_{INT\max} = 20 \text{ mA} \times 3.5 \text{ V} = 70 \text{ mW}$$

$$P_{IO\max} = 20 \times 8 \text{ mA} \times 0.4 \text{ V} = 64 \text{ mW}$$

This gives:  $P_{INT\max} = 70 \text{ mW}$  and  $P_{IO\max} = 64 \text{ mW}$ :

$$P_{D\max} = 70 + 64 = 134 \text{ mW}$$

Thus:  $P_{D\max} = 134 \text{ mW}$

Using the values obtained in [Table 68](#)  $T_{J\max}$  is calculated as follows:

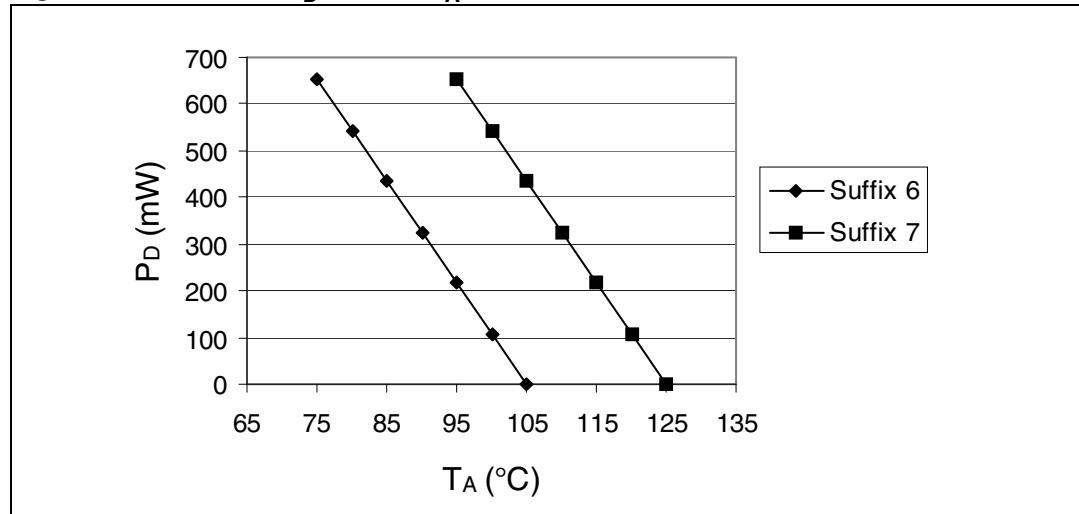

- For LQFP100, 46 °C/W

$$T_{J\max} = 115 \text{ }^{\circ}\text{C} + (46 \text{ }^{\circ}\text{C/W} \times 134 \text{ mW}) = 115 \text{ }^{\circ}\text{C} + 6.2 \text{ }^{\circ}\text{C} = 121.2 \text{ }^{\circ}\text{C}$$

This is within the range of the suffix 7 version parts ( $-40 < T_J < 125 \text{ }^{\circ}\text{C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 7 (see [Table 69: Ordering information scheme](#)).

## 7 Part numbering

**Table 69. Ordering information scheme**

Example:

**Device family**

STM32 = ARM-based 32-bit microcontroller

**Product type**

F = general-purpose

**Device subfamily**

103 = performance line

**Pin count**

R = 64 pins

V = 100 pins

Z = 144 pins

**Flash memory size**

C = 256 Kbytes of Flash memory

D = 384 Kbytes of Flash memory

E = 512 Kbytes of Flash memory

**Package**

H = BGA

T = LQFP

**Temperature range**

6 = Industrial temperature range, -40 to 85 °C.

7 = Industrial temperature range, -40 to 105 °C.

**Options**

xxx = programmed parts

TR = tape and reel

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST sales office.
