

TS27M4C, TS27M4I, TS27M4M

Precision low power CMOS quad operational amplifiers

Features

- Low power consumption: 150 $\mu\text{A}/\text{op}$
- Output voltage can swing to ground
- Excellent phase margin on capacitive loads
- Unity gain stable
- Two input offset voltage selections

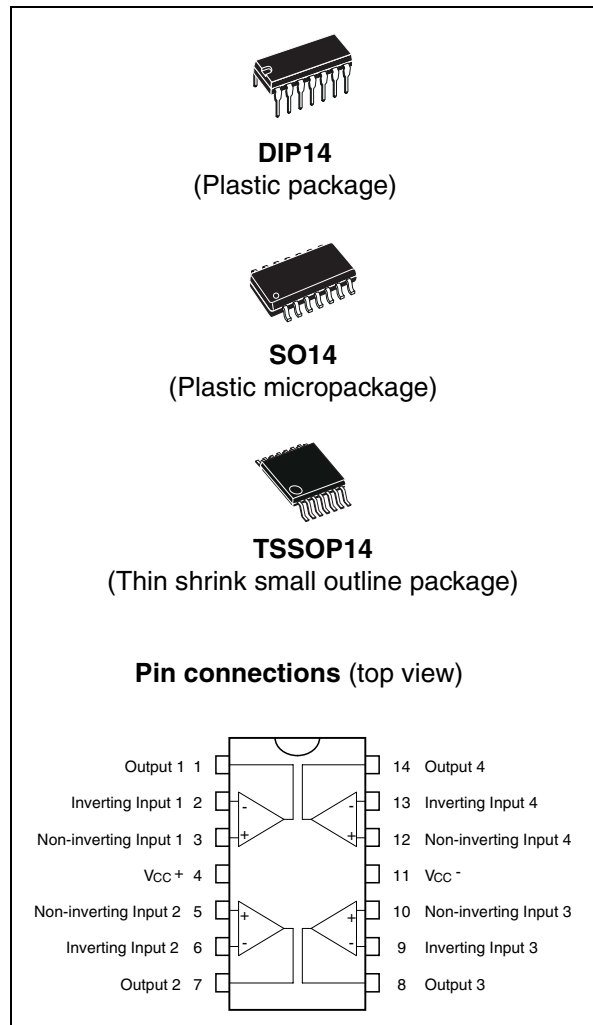

Description

These devices are low cost, low power quad operational amplifiers designed to operate with single or dual supplies. These operational amplifiers use the ST silicon gate CMOS process allowing an excellent consumption-speed ratio. These series are ideally suited for low consumption applications.

Three power consumptions are available thus offering the best consumption-speed ratio for your application:

- $I_{CC} = 10 \mu\text{A}/\text{amp}$: TS27L4 (very low power)
- $I_{CC} = 150 \mu\text{A}/\text{amp}$: TS27M4 (low power)
- $I_{CC} = 1 \text{ mA}/\text{amp}$: TS274 (standard)

These CMOS amplifiers offer very high input impedance and extremely low input currents. The major advantage versus JFET devices is the very low input currents drift with temperature (see [Figure 4 on page 7](#)).

Table 1. Absolute maximum ratings (AMR)

Symbol	Parameter	TS27M4C/AC	TS27M4I/AI	TS27M4M/AM	Unit
V_{CC+}	Supply voltage ⁽¹⁾	18			V
V_{id}	Differential input voltage ⁽²⁾	± 18			V
V_{in}	Input voltage ⁽³⁾	-0.3 to 18			V
I_o	Output current for $V_{CC+} \geq 15V$	± 30			mA
I_{in}	Input current	± 5			mA
T_{oper}	Operating free-air temperature range	0 to +70	-40 to +125	-55 to +125	°C
T_{stg}	Storage temperature range	-65 to +150			°C
R_{thja}	Thermal resistance junction to ambient ⁽⁴⁾				°C/W
	SO-14	105			
	TSSOP14	100			
R_{thjc}	Thermal resistance junction to case ⁽⁴⁾				°C/W
	SO-14	31			
	TSSOP14	32			
ESD	HBM: human body model ⁽⁵⁾	1			kV
	MM: machine model ⁽⁶⁾	100			V
	CDM: charged device model ⁽⁷⁾	1.5			kV

- All values, except differential voltage are with respect to network ground terminal.
- Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
- The magnitude of the input and the output voltages must never exceed the magnitude of the positive supply voltage.
- Short-circuits can cause excessive heating and destructive dissipation. Values are typical.
- Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

4 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: www.st.com.
