

## 混合信号微控制器

### 特性

- 低电源电压范围： **1.8V 至 3.6V**
- 超低功耗
  - 运行模式： **230  $\mu$ A**（在 **1 MHz** 频率下）， **2.2 V**
  - 待机模式： **0.5 $\mu$ A**
  - 关断模式（RAM 保持）： **0.1 $\mu$ A**
- **5** 种节能模式
- 可在不到 **1 $\mu$ s** 的时间里超快速地从待机模式唤醒
- **16 位 RISC** 架构、 **62.5ns** 指令周期
- 基本时钟模块配置
  - 高达 **16 MHz** 的内部频率，具有 **4** 种校准频率
  - 内部超低功耗低频 (**LF**) 振荡器
  - **32-kHz** 晶体
  - 外部数字时钟信号源
- 具有 **3** 个捕获/比较寄存器的两个 **16 位 Timer\_A**
- 多达 **24** 个支持触摸感测的 **I/O** 引脚
- 通用串行通信接口 (**USCI**)
  - 增强型 **UART** 可支持自动波特率检测 (**LIN**)
  - **IrDA** 编码器和解码器
  - 同步 **SPI**
  - **I<sup>2</sup>C**<sup>™</sup>
- 带内部基准、采样与保持以及自动扫描功能的 **10 位 200-ksps** 模数 (**A/D**) 转换器 (See [表 1](#))
- 欠压检测器
- 串行板上编程，无需从外部进行电压编程，利用安全熔丝 (**Security Fuse**) 实现可编程代码保护
- 具有 **Spy-Bi-Wire** 接口的片上仿真逻辑电路
- 系列成员汇总于 [表 1](#)
- 封装选项
  - **TSSOP**: **20** 引脚, **28** 引脚
  - **PDIP**: **20** 引脚
  - **QFN**: **32** 引脚
- 完整的模块说明，请查阅 **MSP430x2xx** 系列用户指南 (文献编号 [SLAU144](#))

### 说明

德州仪器 (TI) MSP430 系列超低功耗微控制器包含多种器件，它们具有面向各种应用的不同外设集。这种架构与 5 种低功耗模式相组合，专为在便携式测量应用中延长电池的使用寿命而优化。该器件具有一个强大的 16 位 RISC CPU、16 位寄存器和有助于获得最大编码效率的常数发生器。数字控制振荡器 (DCO) 可在不到 1  $\mu$ s 的时间里完成从低功耗模式至运行模式的唤醒。

MSP430G2x03 和 MSP430G2x33 系列是超低功耗混合信号微控制器，具有内置的 16 位定时器、多达 24 个支持触摸感测的 I/O 引脚、以及采用通用串行通信接口的内置通信能力。此外，MSP430G2x33 系列成员还具有一个 10 位 A/D 转换器。有关配置的详情请见 [表 1](#)。

典型应用包括低成本传感器系统，此类系统负责捕获模拟信号、将之转换为数字值、随后对数据进行处理以进行显示或传送至主机系统。

## SHORT-FORM DESCRIPTION

### CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

## Operating Modes

The MSP430 has one active mode and five software selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - DCO's dc generator is disabled if DCO not used in active mode
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc generator remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc generator is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc generator is disabled
  - Crystal oscillator is stopped

## Interrupt Vector Addresses

The interrupt vectors and the power-up starting address are located in the address range 0FFFFh to 0FFC0h. The vector contains the 16-bit address of the appropriate interrupt handler instruction sequence.

If the reset vector (located at address 0FFFEh) contains 0FFFFh (for example, flash is not programmed), the CPU goes into LPM4 immediately after power-up.

- (1) A reset is generated if the CPU tries to fetch instructions from within the module register memory address range (0h to 01FFh) or from within unused address ranges.
- (2) Multiple source flags
- (3) (non)-maskable: the individual interrupt-enable bit can disable an interrupt event, but the general interrupt enable cannot.
- (4) Interrupt flags are located in the module.
- (5) In SPI mode: UCB0RXIFG. In I2C mode: UCALIFG, UCNACKIFG, ICSTTIFG, UCSTPIFG.
- (6) In UART/SPI mode: UCB0TXIFG. In I2C mode: UCB0RXIFG, UCB0TXIFG.
- (7) This location is used as bootstrap loader security key (BSLSKEY). A 0xAA55 at this location disables the BSL completely. A zero (0h) disables the erasure of the flash if an invalid password is supplied.
- (8) The interrupt vectors at addresses 0FFDEh to 0FFC0h are not used in this device and can be used for regular program code if necessary.

### Special Function Registers (SFRs)

Most interrupt and module enable bits are collected into the lowest address space. Special function register bits not allocated to a functional purpose are not physically present in the device. Simple software access is provided with this arrangement.

- Legend**
- rw:** Bit can be read and written.
  - rw-0,1:** Bit can be read and written. It is reset or set by PUC.
  - rw-(0,1):** Bit can be read and written. It is reset or set by POR.
  -  SFR bit is not present in device.

### Bootstrap Loader (BSL)

The MSP430 BSL enables users to program the flash memory or RAM using a UART serial interface. Access to the MSP430 memory via the BSL is protected by user-defined password. For complete description of the features of the BSL and its implementation, see the *MSP430 Programming Via the Bootstrap Loader User's Guide* (SLAU319).

### Flash Memory

The flash memory can be programmed via the Spy-Bi-Wire/JTAG port or in-system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 64 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A contains calibration data. After reset segment A is protected against programming and erasing. It can be unlocked but care should be taken not to erase this segment if the device-specific calibration data is required.

## Peripherals

Peripherals are connected to the CPU through data, address, and control buses and can be handled using all instructions. For complete module descriptions, see the *MSP430x2xx Family User's Guide (SLAU144)*.

## Oscillator and System Clock

The clock system is supported by the basic clock module that includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator and an internal digitally controlled oscillator (DCO). The basic clock module is designed to meet the requirements of both low system cost and low power consumption. The internal DCO provides a fast turn-on clock source and stabilizes in less than 1  $\mu$ s. The basic clock module provides the following clock signals:

- Auxiliary clock (ACLK), sourced either from a 32768-Hz watch crystal or the internal LF oscillator.
- Main clock (MCLK), the system clock used by the CPU.
- Sub-Main clock (SMCLK), the sub-system clock used by the peripheral modules.

The DCO settings to calibrate the DCO output frequency are stored in the information memory segment A.

## Calibration Data Stored in Information Memory Segment A

Calibration data is stored for both the DCO and for ADC10 organized in a tag-length-value structure.

## Brownout

The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off.

## Digital I/O

Up to three 8-bit I/O ports are implemented:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt condition (port P1 and port P2 only) is possible.
- Edge-selectable interrupt input capability for all bits of port P1 and port P2 (if available).
- Read/write access to port-control registers is supported by all instructions.
- Each I/O has an individually programmable pullup/pulldown resistor.
- Each I/O has an individually programmable pin oscillator enable bit to enable low-cost touch sensing.

## WDT+ Watchdog Timer

The primary function of the watchdog timer (WDT+) module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be disabled or configured as an interval timer and can generate interrupts at selected time intervals.

## Timer\_A3 (TA0, TA1)

Timer0\_A3 and Timer1\_A3 are 16-bit timers/counters with three capture/compare registers. Timer\_A3 can support multiple capture/compares, PWM outputs, and interval timing. Timer\_A3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

**Universal Serial Communications Interface (USCI)**

The USCI module is used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3 or 4 pin) and I2C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection (LIN), and IrDA. Not all packages support the USCI functionality.

USCI\_A0 provides support for SPI (3 or 4 pin), UART, enhanced UART, and IrDA.

USCI\_B0 provides support for SPI (3 or 4 pin) and I2C.

**ADC10 (MSP430G2x33 Only)**

The ADC10 module supports fast 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator, and data transfer controller (DTC) for automatic conversion result handling, allowing ADC samples to be converted and stored without any CPU intervention.

### Absolute Maximum Ratings<sup>(1)</sup>

|   |                     |                            |
|---|---------------------|----------------------------|
| Voltage applied at $V_{CC}$ to $V_{SS}$             |                     | -0.3 V to 4.1 V            |
| Voltage applied to any pin <sup>(2)</sup>           |                     | -0.3 V to $V_{CC} + 0.3$ V |
| Diode current at any device pin                     |                     | $\pm 2$ mA                 |
| Storage temperature range, $T_{stg}$ <sup>(3)</sup> | Unprogrammed device | -55°C to 150°C             |
|   | Programmed device   | -40°C to 150°C             |

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to  $V_{SS}$ . The JTAG fuse-blow voltage,  $V_{FB}$ , is allowed to exceed the absolute maximum rating. The voltage is applied to the TEST pin when blowing the JTAG fuse.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

### Recommended Operating Conditions

|--------------|---|---|-----|-----|------|-----|
| $V_{CC}$     | Supply voltage  | During program execution                        |     | 1.8 | 3.6  | V   |
|              |   | During flash programming/erase                  |     | 2.2 | 3.6  |     |
| $V_{SS}$     | Supply voltage  |   |     | 0   | V    |     |
| $T_A$        | Operating free-air temperature  | I version                                       |     | -40 | 85   | °C  |
| $f_{SYSTEM}$ | Processor frequency (maximum MCLK frequency using the USART module) <sup>(1)(2)</sup> | $V_{CC} = 1.8$ V,<br>Duty cycle = 50% $\pm$ 10% |     | dc  | 6    | MHz |
|              |   | $V_{CC} = 2.7$ V,<br>Duty cycle = 50% $\pm$ 10% |     | dc  | 12   |     |
|              |   | $V_{CC} = 3.3$ V,<br>Duty cycle = 50% $\pm$ 10% |     | dc  | 16   |     |

- (1) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse width of the specified maximum frequency.
- (2) Modules might have a different maximum input clock specification. See the specification of the respective module in this data sheet.

Note: Minimum processor frequency is defined by system clock. Flash program or erase operations require a minimum  $V_{CC}$  of 2.2 V.

- (1) A resistive divider with two 0.5-kΩ resistors between V<sub>CC</sub> and V<sub>SS</sub> is used as load. The output is connected to the center tap of the divider.
- (2) The output voltage reaches at least 10% and 90% V<sub>CC</sub> at the specified toggle frequency.

## Main DCO Characteristics

- All ranges selected by RSELx overlap with RSELx + 1: RSELx = 0 overlaps RSELx = 1, ... RSELx = 14 overlaps RSELx = 15.
- DCO control bits DCOx have a step size as defined by parameter S<sub>DCO</sub>.
- Modulation control bits MODx select how often f<sub>DCO(RSEL,DCO+1)</sub> is used within the period of 32 DCOCLK cycles. The frequency f<sub>DCO(RSEL,DCO)</sub> is used for the remaining cycles. The frequency is an average equal to:

$$f_{\text{average}} = \frac{32 \times f_{\text{DCO(RSEL,DCO)}} \times f_{\text{DCO(RSEL,DCO+1)}}}{\text{MOD} \times f_{\text{DCO(RSEL,DCO)}} + (32 - \text{MOD}) \times f_{\text{DCO(RSEL,DCO+1)}}}$$

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - (a) Keep the trace between the device and the crystal as short as possible.
  - (b) Design a good ground plane around the oscillator pins.
  - (c) Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - (d) Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - (e) Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
  - (f) If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
  - (g) Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.
- (2) Includes parasitic bond and package capacitance (approximately 2 pF per pin).  
Since the PCB adds additional capacitance, it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (3) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (4) Measured with logic-level input frequency but also applies to operation with crystals.

(1) The DCO wake-up time must be considered in LPM3/4 for baud rates above 1 MHz.

(2) Pulses on the UART receive input (UCxRX) shorter than the UART receive deglitch time are suppressed. To ensure that pulses are correctly recognized, their width should exceed the maximum specification of the deglitch time.

- (1) The leakage current is defined in the leakage current table with P<sub>x.y</sub>/A<sub>x</sub> parameter.
- (2) The analog input voltage range must be within the selected reference voltage range V<sub>R+</sub> to V<sub>R-</sub> for valid conversion results.
- (3) The internal reference supply current is not included in current consumption parameter I<sub>ADC10</sub>.
- (4) The internal reference current is supplied via terminal V<sub>CC</sub>. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables the built-in reference to settle before starting an A/D conversion.

- (1) The external reference is used during conversion to charge and discharge the capacitance array. The input capacitance, C<sub>I</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) Under this condition the external reference is internally buffered. The reference buffer is active and requires the reference buffer supply current I<sub>REFB</sub>. The current consumption can be limited to the sample and conversion period with REBURST = 1.
- (4) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (5) The accuracy limits the minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.

- (1) The sensor current  $I_{SENSOR}$  is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1,  $I_{SENSOR}$  is included in  $I_{REF+}$ . When REFON = 0,  $I_{SENSOR}$  applies during conversion of the temperature sensor input (INCH = 0Ah).
- (2) The following formula can be used to calculate the temperature sensor output voltage:  

$$V_{Sensor,typ} = TC_{Sensor} (273 + T [^\circ\text{C}]) + V_{Offset,sensor} [\text{mV}]$$

$$V_{Sensor,typ} = TC_{Sensor} T [^\circ\text{C}] + V_{Sensor}(T_A = 0^\circ\text{C}) [\text{mV}]$$
- (3) The typical equivalent impedance of the sensor is 51 k $\Omega$ . The sample time required includes the sensor-on time  $t_{SENSOR(on)}$ .
- (4) No additional current is needed. The  $V_{MID}$  is used during sampling.
- (5) The on-time  $t_{VMID(on)}$  is included in the sampling time  $t_{VMID(sample)}$ ; no additional on time is needed.

- (1) The cumulative program time must not be exceeded when writing to a 64-byte flash block. This parameter applies to all programming methods: individual word/byte write and block write modes.
- (2) These values are hardwired into the Flash Controller's state machine ( $t_{FTG} = 1/f_{FTG}$ ).

## RAM

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER    |   | TEST CONDITIONS | MIN | MAX | UNIT |
|--------------|---|-----------------|-----|-----|------|
| $V_{(RAMh)}$ | RAM retention supply voltage <sup>(1)</sup> | CPU halted      | 1.6 |     | V    |

- (1) This parameter defines the minimum supply voltage  $V_{CC}$  when the data in RAM remains unchanged. No program execution should happen during this supply voltage condition.

## JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER      |   | TEST CONDITIONS | $V_{CC}$ | MIN   | TYP | MAX | UNIT       |
|----------------|---|-----------------|----------|-------|-----|-----|------------|
| $f_{SBW}$      | Spy-Bi-Wire input frequency   |                 | 2.2 V    | 0     |     | 20  | MHz        |
| $t_{SBW,Low}$  | Spy-Bi-Wire low clock pulse length  |                 | 2.2 V    | 0.025 |     | 15  | $\mu$ s    |
| $t_{SBW,En}$   | Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge <sup>(1)</sup> ) |                 | 2.2 V    |       |     | 1   | $\mu$ s    |
| $t_{SBW,Ret}$  | Spy-Bi-Wire return to normal operation time   |                 | 2.2 V    | 15    |     | 100 | $\mu$ s    |
| $f_{TCK}$      | TCK input frequency <sup>(2)</sup>  |                 | 2.2 V    | 0     |     | 5   | MHz        |
| $R_{Internal}$ | Internal pulldown resistance on TEST  |                 | 2.2 V    | 25    | 60  | 90  | k $\Omega$ |

- (1) Tools accessing the Spy-Bi-Wire interface need to wait for the maximum  $t_{SBW,En}$  time after pulling the TEST/SBWCLK pin high before applying the first SBWCLK clock edge.  
 (2)  $f_{TCK}$  may be restricted to meet the timing requirements of the module selected.

## JTAG Fuse<sup>(1)</sup>

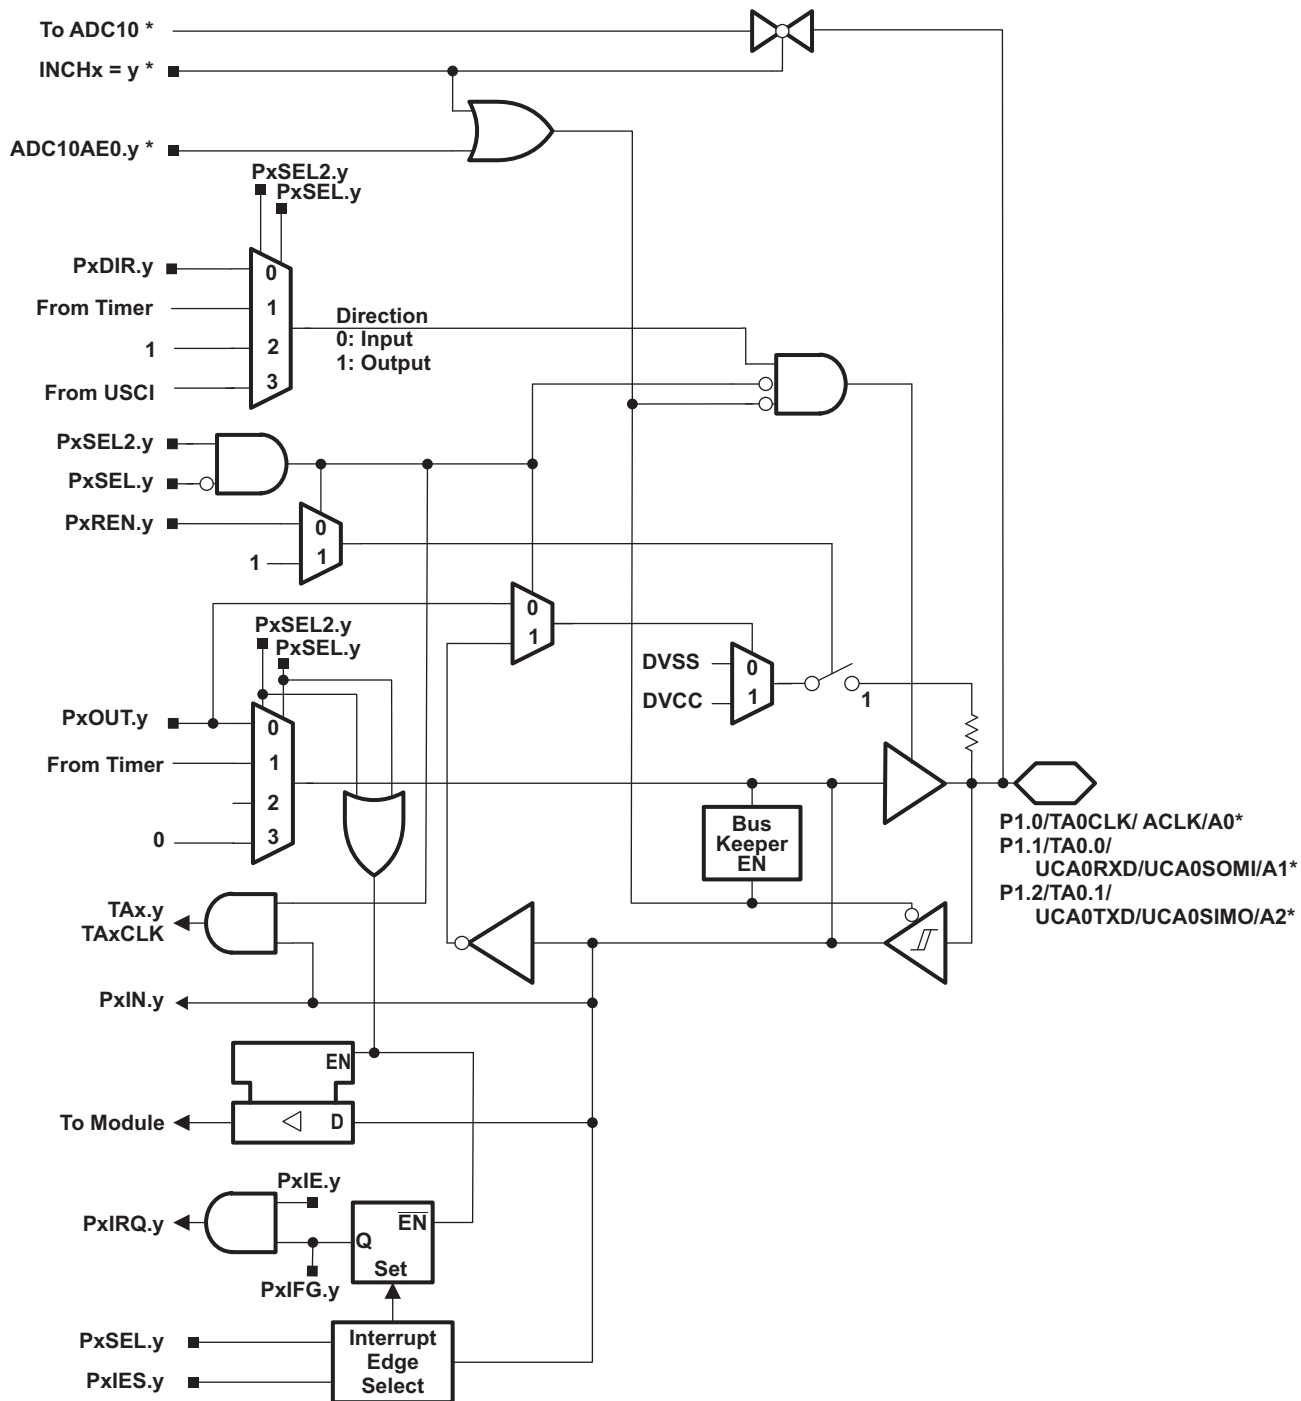

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER    |   | TEST CONDITIONS          | MIN | MAX | UNIT |
|--------------|---|--------------------------|-----|-----|------|
| $V_{CC(FB)}$ | Supply voltage during fuse-blow condition | $T_A = 25^\circ\text{C}$ | 2.5 |     | V    |
| $V_{FB}$     | Voltage level on TEST for fuse blow       |                          | 6   | 7   | V    |
| $I_{FB}$     | Supply current into TEST during fuse blow |                          |     | 100 | mA   |
| $t_{FB}$     | Time to blow fuse                         |                          |     | 1   | ms   |

- (1) Once the fuse is blown, no further access to the JTAG/Test, Spy-Bi-Wire, and emulation feature is possible, and JTAG is switched to bypass mode.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

---

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**THERMAL INFORMATION**

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.
