

16-Channel, 12-Bit PWM LED Driver with 6-Bit Dot Correction and Pre-Charge FET

FEATURES

- 16 Channels, Constant Current Sink Output
- 60-mA Capability (Constant Current Sink)
- 12-Bit (4096 Steps) Grayscale Control with PWM
- 6-Bit (64 Steps) Dot Correction with Sink Current
- Internal Pre-Charge FET to Prevent LED Ghosting Phenomenon on Multiplexed LED Systems
- LED Power-Supply Voltage up to 15 V
- $V_{CC} = 3.0\text{ V to }5.5\text{ V}$
- Constant Current Accuracy:
 - Channel-to-Channel = $\pm 1\%$
 - Device-to-Device = $\pm 3\%$
- CMOS Logic Level I/O
- 30-MHz Data Transfer Rate
- 33-MHz Grayscale Control Clock
- Continuous Base LED Open Detection (LOD):
 - Detect LED opening and LED short to GND during display with auto output off function
- Thermal Shutdown (TSD):
 - Automatic shutdown at over-temperature conditions
 - Restart under normal temperature
- Pre-Thermal Warning (PTW):
 - High temperature operation alert
- Readable Error Information:
 - LED Open Detection (LOD)
 - Thermal Error Flag (TEF)
 - Pre-Thermal Warning (PTW)
- Noise Reduction:
 - 4-channel grouped delay to prevent inrush current
- Operating Temperature: $-40^{\circ}\text{C to }+85^{\circ}\text{C}$

APPLICATIONS

- Monochrome, Multicolor, Full-Color LED Displays Using Multiplexing System
- LED Signboards Using Multiplexing System

Typical Application Circuit (Multiple Daisy-Chained TLC5944s)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments, Incorporated.
All other trademarks are the property of their respective owners.

DESCRIPTION

The TLC5944 is a 16-channel, constant current sink driver. Each channel is individually adjustable with 4096 pulse-width modulated (PWM) steps and 64 constant sink current (dot correction) steps. The dot correction (DC) adjusts for brightness variations between LEDs. Both grayscale (GS) control and DC are accessible via a common serial interface port. The maximum current value of all 16 channels can be set by a single external resistor.

The TLC5944 has an internal pre-charge FET to prevent the ghost-lighting phenomenon that occurs on multiplexed LED systems. The TLC5944 has three error detection circuits for LED open detection (LOD), a thermal error flag (TEF), and a pre-thermal warning (PTW). The LOD detects a broken or disconnected LED, and a shorted LED to GND during the display period. The TEF indicates a too-high temperature condition; when the TEF is set, all output drivers are turned off by the thermal shutdown (TSD) protection. Additionally, when the TEF is cleared, all output drivers are restarted. The PTW indicates that the IC is operating in a high temperature condition. The output drivers remain on when PTW is set.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION⁽¹⁾

PRODUCT	PACKAGE-LEAD	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
TLC5944	HTSSOP-28 PowerPAD™	TLC5944PWPR	Tape and Reel, 2000
		TLC5944PWP	Tube, 50
TLC5944	5 mm × 5 mm QFN-32	TLC5944RHBR	Tape and Reel, 3000
		TLC5944RHBT	Tape and Reel, 250

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾

Over operating free-air temperature range, unless otherwise noted.

PARAMETER		TLC5944	UNIT
V _{CC}	Supply voltage, V _{CC}	–0.3 to +6.0	V
V _{UP}	Pre-charge voltage	–0.3 to +16	V
I _{OUT}	Output current (dc)	XERR	6
		OUT0 to OUT15	70
V _{IN}	Input voltage range: SIN, SCLK, XLAT, BLANK, GSCLK, DCSEL, IREF	–0.3 to V _{CC} + 0.3	V
V _{OUT}	Output voltage range	SOUT, XERR	–0.3 to V _{CC} + 0.3
		OUT0 to OUT15	–0.3 to V _{UP} + 0.3
T _{J(max)}	Operating junction temperature	+150	°C
T _{STG}	Storage temperature range	–55 to +150	°C
ESD rating	Human body model (HBM)	2	kV
	Charged device model (CDM)	500	V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.

(2) All voltage values are with respect to network ground terminal.

RECOMMENDED OPERATING CONDITIONS

At $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	TLC5944			UNIT
		MIN	NOM	MAX	
DC Characteristics: $V_{CC} = 3\text{ V to }5.5\text{ V}$

- (1) With PowerPAD soldered onto copper area on printed circuit board (PCB); 2-oz. copper. For more information, see [SLMA002](#) (available for download at www.ti.com).
- (2) With PowerPAD not soldered onto copper area on PCB.
- (3) The package thermal impedance is calculated in accordance with JESD51-5.

ELECTRICAL CHARACTERISTICS

At $V_{CC} = 3.0\text{ V}$ to 5.5 V and $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$. Typical values at $V_{CC} = 3.3\text{ V}$ and $T_A = +25^\circ\text{C}$, unless otherwise noted.

PARAMETER		TEST CONDITIONS	TLC5944			UNIT
			MIN	TYP	MAX	
V_{OH}	High-level output voltage	$I_{OH} = -1\text{ mA}$ at SOUT	$V_{CC} - 0.4$		V_{CC}	V
V_{OL}	Low-level output voltage	$I_{OL} = 1\text{ mA}$ at SOUT	0		0.4	V
		$I_{OL} = 5\text{ mA}$ at XERR	0		0.4	V
I_{IN}	Input current	$V_{IN} = V_{CC}$ or GND at SIN, SCLK, XLAT, GSCLK, BLANK, DCSEL	-1		1	μA
I_{CC1}	Supply current (V_{CC})	SIN/SCLK/GSCLK/XLAT/DCSEL = low, BLANK = high, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 24\text{ k}\Omega$		1	2	mA
I_{CC2}		SIN/SCLK/GSCLK/XLAT/DCSEL = low, BLANK = high, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 1.6\text{ k}\Omega$		5	10	mA
I_{CC3}		SCLK = 30 MHz, GSCLK = 33 MHz, SIN = 15 MHz, XLAT/DCSEL = low, BLANK = low during 4095 GSCLK period and high during 1 GSCLK period, GSn = FFFh, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 1.6\text{ k}\Omega$		17	35	mA
I_{CC4}		SCLK = 30 MHz, GSCLK = 33 MHz, SIN = 15 MHz, XLAT/DCSEL = low, BLANK = low during 4095 GSCLK period and high during 1 GSCLK period, GSn = FFFh, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 820\ \Omega$		30	60	mA
$I_{O(LC)}$	Constant output current	All OUTn = ON, DCn = 3Fh, $V_{OUTn} = V_{OUTfix} = 1\text{ V}$, $R_{IREF} = 1\text{ k}\Omega$ (see Figure 9), at OUT0 to OUT15	54	60	66	mA
$I_{O(LKG)}$	Leakage output current	All OUTn for constant current driver, all output off, BLANK = high, $V_{OUTn} = V_{OUTfix} = 15\text{ V}$, $V_{UP} = 15\text{ V}$, $R_{IREF} = 820\ \Omega$ (see Figure 10), at OUT0 to OUT15			0.1	μA
$I_{O(LKG1)}$		All OUTn for pre-charge FET, all output off, BLANK = low, $V_{OUTn} = V_{OUTfix} = 0\text{ V}$, $V_{UP} = 15\text{ V}$, $R_{IREF} = 820\ \Omega$ (see Figure 10), at OUT0 to OUT15			-10	μA
$I_{O(LKG2)}$		XERR, no error status, $V_{OUTn} = 5.5\text{ V}$			1	μA
$\Delta I_{O(LC)}$	Constant current error (channel-to-channel) ⁽¹⁾	All OUTn = ON, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 820\ \Omega$, at OUT0 to OUT15		± 1	± 3	%
$\Delta I_{O(LC1)}$	Constant current error (device-to-device) ⁽²⁾	All OUTn = ON, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 820\ \Omega$, at OUT0 to OUT15		± 3	± 6	%
$\Delta I_{O(LC2)}$	Line regulation ⁽³⁾	All OUTn = ON, DCn = 3Fh, $V_{OUTn} = 1\text{ V}$, $R_{IREF} = 820\ \Omega$, at OUT0 to OUT15		± 0.5	± 1	%/V

(1) The deviation of each output from the average of OUT0–OUT15 constant current. Deviation is calculated by the formula:

$$\Delta (\%) = \left[\frac{I_{OUTn}}{\frac{(I_{OUT0} + I_{OUT1} + \dots + I_{OUT14} + I_{OUT15})}{16}} - 1 \right] \times 100$$

(2) The deviation of the OUT0–OUT15 constant current average from the ideal constant current value.

Deviation is calculated by the following formula:

$$\Delta (\%) = \left[\frac{\frac{(I_{OUT0} + I_{OUT1} + \dots + I_{OUT14} + I_{OUT15})}{16} - (\text{Ideal Output Current})}{\text{Ideal Output Current}} \right] \times 100$$

Ideal current is calculated by the formula:

$$I_{OUT(IDEAL)} = 40.5 \times \left[\frac{1.20}{R_{IREF}} \right]$$

(3) Line regulation is calculated by this equation:

$$\Delta (\%/V) = \left[\frac{(I_{OUTn} \text{ at } V_{CC} = 5.5\text{ V}) - (I_{OUTn} \text{ at } V_{CC} = 3.0\text{ V})}{(I_{OUTn} \text{ at } V_{CC} = 3.0\text{ V})} \right] \times \frac{100}{5.5\text{ V} - 3\text{ V}}$$

ELECTRICAL CHARACTERISTICS (continued)

At $V_{CC} = 3.0\text{ V}$ to 5.5 V and $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$. Typical values at $V_{CC} = 3.3\text{ V}$ and $T_A = +25^\circ\text{C}$, unless otherwise noted.

t_{ON_ERR}	Output on-time error ⁽¹⁾	$GS_n = 001h$, $GSCLK = 33\text{ MHz}$	-20		10	ns

(1) Output on-time error is calculated by the following formula: T_{ON_ERR} (ns) = $t_{OUTON} - T_{GSCLK}$. t_{OUTON} is the actual on-time of the constant current driver. T_{GSCLK} is the period of $GSCLK$.

FUNCTIONAL BLOCK DIAGRAM

DEVICE INFORMATION

NC = No internal connection.

TERMINAL FUNCTIONS

TERMINAL			I/O	DESCRIPTION
NAME	PWP	RHB		
SIN	5	2	I	Serial data input for grayscale and dot correction.
SCLK	4	1	I	Serial data shift clock for GS shift register and DC shift register. Schmitt buffer input. The shift register is selected by the DCSEL pin. Data present on the SIN pin are shifted into the shift register selected by DCSEL with the rising edge of the SCLK pin. Data in the selected shift register are shifted to the MSB side by 1-bit synchronizing to the rising edge of SCLK. The MSB data of the selected register appears on SOUT.
XLAT	3	32	I	Data in the GS and DC shift register are moved to the respective data latch with a low-to-high transition of this pin.
DCSEL	6	3	I	Shift register and data latch select. When DCSEL is low, SCLK/XLAT/SOUT are connected to the GS shift register and data latch. When DCSEL is high, SCLK/XLAT/SOUT are connected to the DC shift register and data latch. DCSEL should not be changed while SCLK is high.
GSCLK	25	24	I	Reference clock for grayscale PWM control. If BLANK is low, then each rising edge of GSCLK increments the grayscale counter for PWM control.
BLANK	2	31	I	Blank (all constant current outputs off). When BLANK is high, all constant current outputs (OUT0 through OUT15) are forced off, the grayscale counter is reset to '0', and the grayscale PWM timing controller is initialized. When BLANK is low, all constant current outputs are controlled by the grayscale PWM timing controller.
IREF	27	26	I/O	Constant current value setting. OUT0 through OUT15 sink constant current is set to the desired value by connecting an external resistor between IREF and GND.
SOUT	24	23	O	Serial data output for GS, DC, and status information data (SID). This output is connected to the MSB of the shift register selected by DCSEL.
XERR	23	22	O	Error output. Open-drain output. XERR goes low when LOD or TEF are set. XERR is in high impedance when error free.
OUT0	7	4	O	Constant current output. Each output can be tied to other outputs to increase the constant current.
OUT1	8	5	O	Constant current output
OUT2	9	6	O	Constant current output
OUT3	10	7	O	Constant current output
OUT4	11	8	O	Constant current output

DETAILED DESCRIPTION

Setting for the Maximum Constant Sink Current Value

On the TLC5944, the maximum constant current sink value for each channel, I_{OLCMax} , is determined by an external resistor, R_{IREF} , and GND pins. The R_{IREF} resistor value is calculated with [Equation 1](#):

$$R_{IREF} (k\Omega) = \frac{V_{IREF} (V)}{I_{OLCMax} (mA)} \times 40.5 \quad (1)$$

Where:

- V_{IREF} = the internal reference voltage on the IREF pin (typically 1.20 V)

I_{OLCMax} is the largest current for all outputs. Each output sinks the I_{OLCMax} current when it is turned on and the dot correction is set to the maximum value of 3Fh (63d). The sink current for each output can be reduced by lowering the respective output dot correction data.

R_{IREF} must be between 810 Ω (typ) and 24.3 k Ω (typ) in order to keep I_{OLCMax} between 2 mA and 60 mA. The output may become unstable when I_{OLCMax} is set lower than 2 mA. However, output currents lower than 2 mA can be achieved by setting I_{OLCMax} to 2 mA or higher, and then using dot correction to lower the output current.

[Figure 17](#) in the Typical Characteristics and [Table 1](#) show the characteristics of the constant sink current versus the external resistor, R_{IREF} .

Table 1. Maximum Constant Current Output versus External Resistor Value

I_{OLCMax} (mA, Typical)	R_{IREF} (Ω)
60	810

50	972
45	1080
40	1215
35	1389
30	1620
25	1944
20	2430
15	3240
10	4860
5	9720
2	24300

Dot Correction (DC) Function

The TLC5944 is able to individually adjust the output current of each channel (OUT0 to OUT15). This function is called *dot correction* (DC). The DC function allows users to individually adjust the brightness and color deviations of LEDs connected to the outputs OUT0 to OUT15. Each respective channel output current can be adjusted in 64 steps from 0% to 100% of the maximum output current, I_{OLCMax} . Dot correction data are entered into the TLC5944 via the serial interface.

Equation 2 determines the sink current for each output (OUTn):

$$I_{OUTn} \text{ (mA)} = I_{OLCMax} \text{ (mA)} \times \frac{DCn}{63d} \quad (2)$$

Where:

- I_{OLCMax} = the maximum channel current for each channel determined by R_{IREF}
- DCn = the programmed dot correction value for OUTn (DCn = 0 to 63d)

When the IC is powered on, the data in the dot correction shift register and data latch are not set to any default values. Therefore, DC data must be written to the DC latch before turning on the constant current output.

Table 2 summarizes the DC data versus current ratio and set current value.

Table 2. DC Data versus Current Ratio and Set Current Value

DC DATA (Binary)	DC DATA (Decimal)	DC DATA (Hex)	SET CURRENT RATIO TO MAX CURRENT (%)	OUTPUT CURRENT (mA, Typical) AT $I_{OLCMax} = 60 \text{ mA}$	OUTPUT CURRENT (mA, Typical) AT $I_{OLCMax} = 2 \text{ mA}$
00 0000	0	00	0.0	0.0	0.000
00 0001	1	01	1.6	0.4	0.032
00 0010	2	02	3.2	0.8	0.064

11 1110	62	3E	98.4	59.0	1.968
11 1111	63	3F	100.0	60.0	2.000

Grayscale (GS) Function (PWM Operation)

The pulse width modulation (PWM) operation is controlled by a 12-bit grayscale counter that is clocked on each rising edge of the grayscale reference clock (GSCLK). The counter is reset to zero when BLANK is high. The counter value is held at zero while BLANK is high, even if the GSCLK input is toggled high and low. After the falling edge of BLANK, the counter increments with each rising edge of GSCLK. Any constant current sink output (OUT0 through OUT15) with a nonzero value in the corresponding grayscale latch starts to sink current after the first rising edge of GSCLK following a high-to-low transition of BLANK. The internal counter keeps track of the number of GSCLK pulses. Each output channel stays on as long as the internal counter is equal to or less than the respective output GSCLK. Each channel turns off at the rising edge of GSCLK when the grayscale counter value is larger than the grayscale latch value.

For example, an output that has a grayscale latch value of '1' turns on at the first rising edge of GSCLK after BLANK goes low. It turns off at the second rising edge of GSCLK. Figure 27 shows the PWM timing diagram.

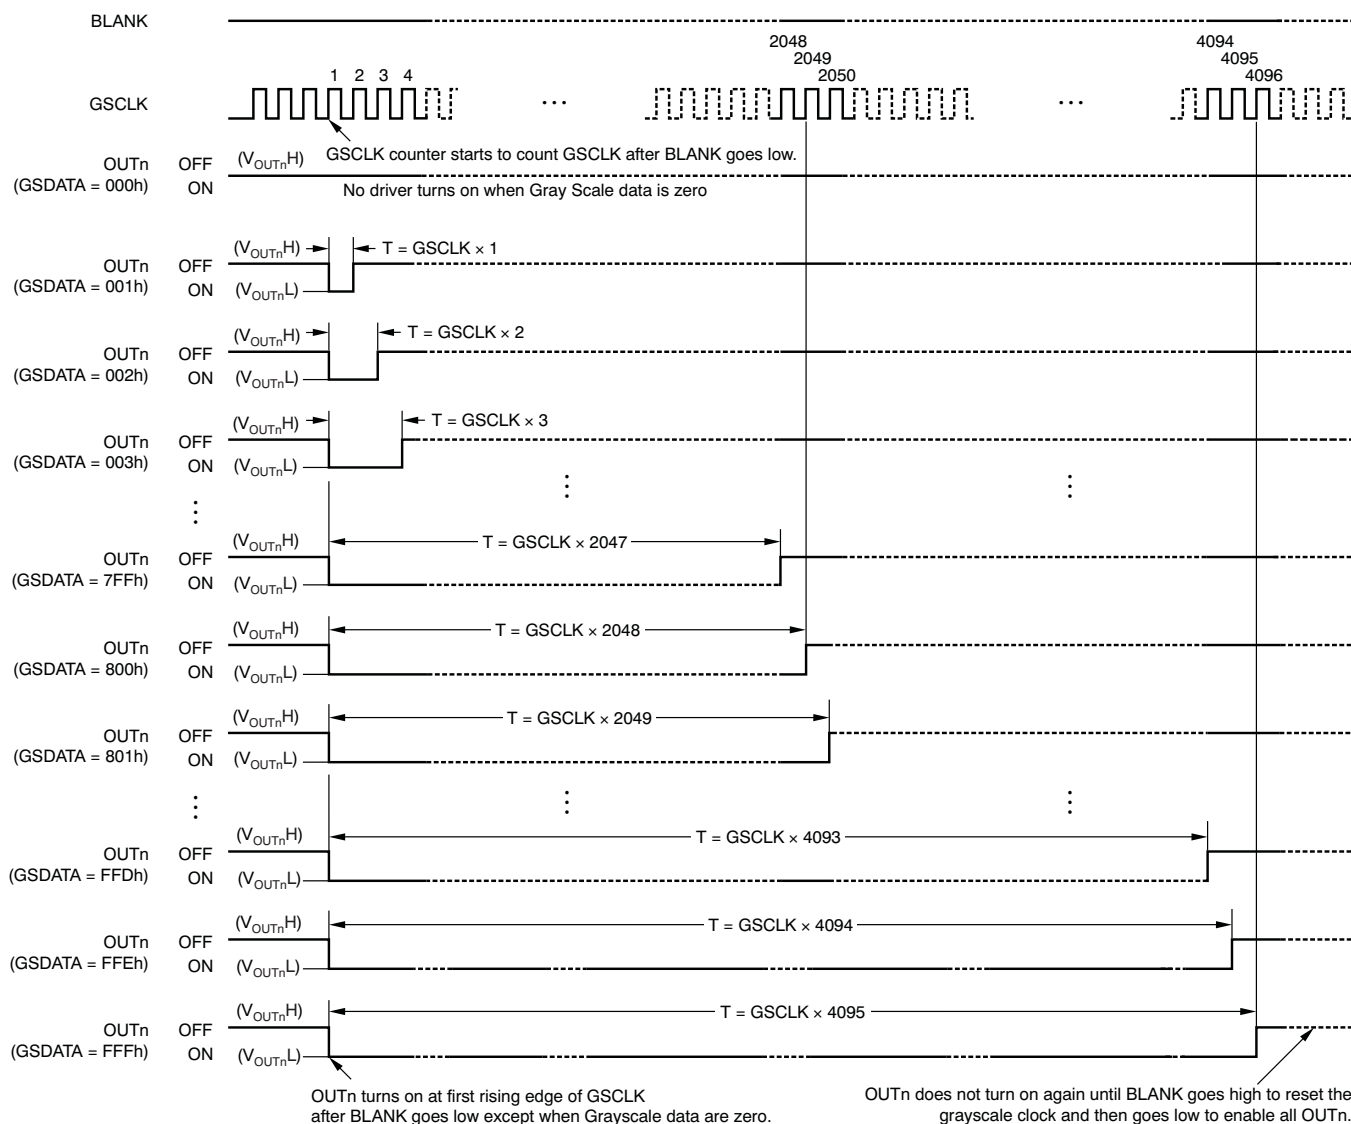

Figure 27. PWM Operation Timing

When the IC powers on, the data in the grayscale shift register and latch are not set to any default value. Therefore, grayscale data must be written to the grayscale latch before turning on the constant current output. Additionally, BLANK should be held high when the device turns on, to prevent the outputs from turning on before the proper grayscale and dot correction values can be written. All constant current outputs are forced off when BLANK is high. Equation 3 determines the on time (t_{OUTON}) for each output (OUTn).

$$t_{\text{OUTON}} (\text{ns}) = t_{\text{GSCLK}} (\text{ns}) \times \text{GSn} \quad (3)$$

Where:

- T_{GSCLK} = the period of GSCLK
- GS_n = the programmed grayscale value for OUT_n (GS_n = 0 to 4095d)

If GS data change during a display period because XLAT goes high, and latches new GS data, the internal data latch registers are immediately updated. This action can cause the outputs to turn on or off unexpectedly. For proper operation, GS data should only be latched into the IC at the end of a display period when BLANK is high. Table 3 summarizes the GS data versus OUT_n on duty and on time.

Table 3. GS Data versus OUT_n On Duty and OUT_n On Time

GS DATA (Binary)	GS DATA (Decimal)	GS DATA (Hex)	OUT _n ON DUTY RATIO TO MAXIMUM CODE (%)	OUT _n ON-TIME (ns, Typical) AT 33-MHz GSCLK

Grayscale (GS) Shift Register and Data Latch

The grayscale (GS) shift registers and data latches are each 192 bits in length, and set the PWM timing for each constant current driver. See Table 3 for the ON time duty of each GS data bit. Figure 28 shows the shift register and latch configuration. Refer to Figure 14 for the timing diagram for writing data into the GS shift register and latch.

The driver on time is controlled by the data in the GS data latch. GS data present on the SIN pin are clocked into the GS shift register with each rising edge of the GSCLK pin when DCSEL is low. Data are shifted in MSB first. Data are latched from the shift register into the GS data latch with a rising edge on the XLAT pin. A DCSEL level change is allowed when SCLK is low and 100 ns after the rising edge of XLAT.

When the device powers up, the data in the GS shift register and latches are not set to any default value. Therefore, GS data must be written to the GS latch before turning on the constant current output. Also, BLANK should be at a high level when powering on the device, because the constant current may be turned on as well. All constant current output is off when BLANK is at a high level. The status information data (SID) byte is overwritten on the most significant 18 bits of the grayscale shift register at the first rising edge of GSCLK after XLAT goes low.

Figure 28. Grayscale Shift Register and Data Latch Configuration

Dot Correction (DC) Shift Register and Data Latch

The dot correction (DC) shift register and latches are each 96 bits long and are used to individually adjust the constant current value for each constant current driver. Each channel can be adjusted from 0% to 100% of the maximum LED current with 6-bit resolution. Table 2 describes the percentage of maximum current for each dot correction data. Figure 29 shows the shift register and latch configuration for DC data. Figure 15 illustrates the timing for writing data into the DC shift registers and latches. Each LED channel current is dot-corrected by the percentage value that corresponds to the data in the respective DC data latch. DC data present on the SIN pin are clocked, MSB first, into the DC shift register at each rising edge of the SCLK pin when DCSEL is high. Data are latched from the shift register into the DC data latch with a rising edge on the XLAT pin when DCSEL is high. A DCSEL level change is allowed when SCLK is low and 100 ns after the rising edge of XLAT.

When the IC is powered on, the data in the DC shift register and data latch are not set to any default value. Therefore, dot correction data must be written to the DC latch before turning on the constant current output.

Figure 29. Dot Correction Shift Register and Latch Configuration

Status Information Data (SID)

Status information data (SID) are 18-bit, read-only data. The 16-bit LED open detection (LOD) error, the thermal error flag (TEF), and the pre-thermal warning (PTW) are shifted out onto the SOUT pin with each rising edge of the serial data shift clock, SCLK. The 16 LOD bits for each channel and the two TEF bits are written into the 18 most significant bits of the grayscale shift register at the rising edge of the first SCLK after XLAT goes low. As a result, the previous data in the 18 most significant bits of the grayscale information are lost at the same time. No data are loaded into the other 174 bits. Figure 30 shows the bit assignments. Figure 16 illustrates the read timing for the status information data.

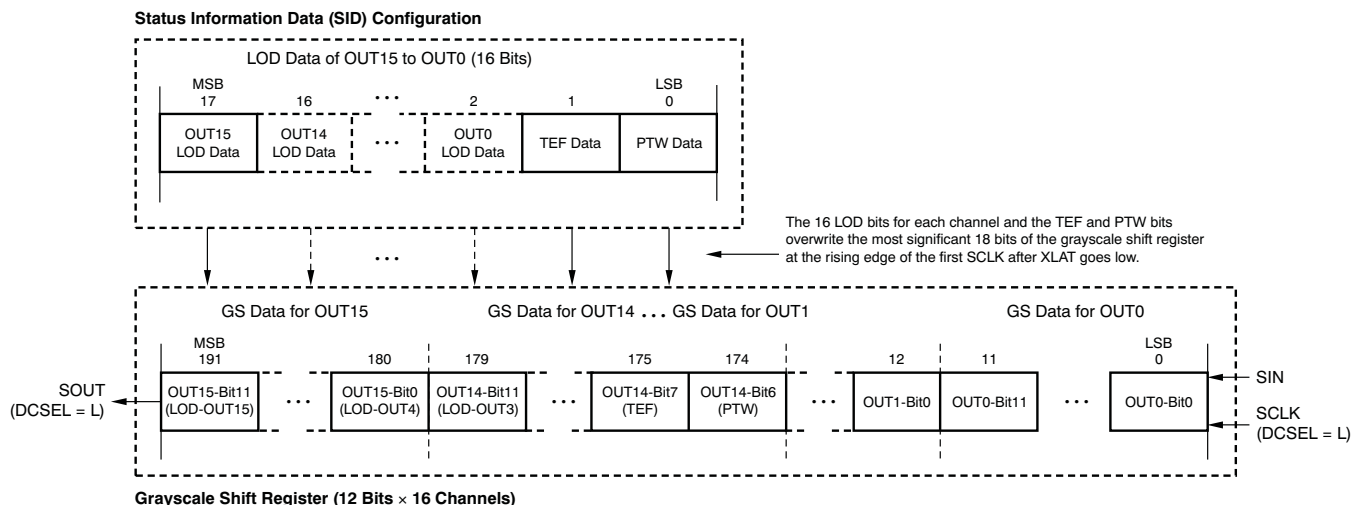

Figure 30. Status Information Data Configuration

The LOD data update at the rising edge of the next 33rd GSCLK of the subsequent PWM cycle; the LOD data are retained until the next 33rd GSCLK. LOD data are only checked for outputs that are turned on during the rising edge of the 33rd GSCLK pulse. A '1' in an LOD bit indicates an open LED condition for the corresponding channel. A '0' indicates normal operation. It is possible for LOD data to show a '0' even if the LED is open when the grayscale data are less than 20h (32d).

The PTW and TEF bits indicate that the IC temperature is high and too high, respectively. The TEF flag also indicates that the IC has turned off all drivers to avoid damage by overheating the device. A '1' in the TEF bit means that the IC temperature has exceeded the detect temperature threshold of high side ($T_{(TEF)}$) and the driver is forced off. A '0' in the TEF bit indicates the driver has not exceeded the high temperature. The PTW flag indicates that the IC temperature has exceeded the detect temperature threshold, but does not force the driver off. A '1' in the PTW bit indicates that the IC temperature has exceeded the pre-thermal warning threshold ($T_{(PTW)}$) but does not force the driver off. A '0' in the PTW bit indicates normal operation with low-side temperature conditions. When the PTW is set, the IC temperature should be reduced by lowering the power dissipated in the driver to avoid a forced shutdown by the thermal shutdown circuit. This reduction can be accomplished by lowering the values of the GS or DC data.

When the IC powers on, LOD data do not show correct values. Therefore, LOD data must be read from the 33rd GSCLK pulse input after BLANK goes low. Table 4 shows a truth table for both LOD and TEF.

Table 4. LOD and TEF Truth Table

SID DATA	CONDITION		
	LED OPEN DETECTION (LODn)	THERMAL ERROR FLAG (TEF)	PRE-THERMAL WARNING (PTW)
0	LED is connected ($V_{OUTn} > V_{LOD}$)	Device temperature is lower than the high-side detect temperature ($temp \leq T_{(TEF)} - T_{(HYST)}$)	Device temperature is lower than the low-side detect temperature ($temp < T_{(PTW)} - T_{(HYSP)}$)
1	LED is open or shorted to GND ($V_{OUTn} \leq V_{LOD}$)	Device temperature is higher than the high-side detect temperature and the driver is forced off ($temp > T_{(TEF)}$)	Device temperature is higher than the low-side detect temperature ($temp \geq T_{(PTW)}$)

Continuous Base LED Open Detection

At the rising edge of the 33rd GSCLK after the falling edge of BLANK, the LED open detection (LOD) circuit checks the voltage of each constant current output (OUT0 through OUT15 = OUTn) that is turned on to detect open LEDs and short LEDs to GND. The channels corresponding to the LOD bit in the status information data (SID) register are set to '1' if the voltage of the OUTn pin (V_{OUTn}) is less than the LED open detection threshold ($V_{LOD} = 0.3 V_{TYP}$). This status information can be read from the SOUT pin when DCSEL is low. No special test sequence is required for LED open detection.

The LOD function automatically checks for open LEDs and short LEDs to GND during each grayscale PWM cycle. The SID information of LOD is latched into the LED open detection data latch and does not change until the rising edge of the 33rd GSCLK pulse following the next falling edge of BLANK. To eliminate false detection of open LEDs, the LED driver design must ensure that the TLC5944 output voltage is greater than V_{LOD} when the outputs are on. The GS data must be 21h (33d) or more to get the LOD result. Figure 31 shows the LED open detection timing.

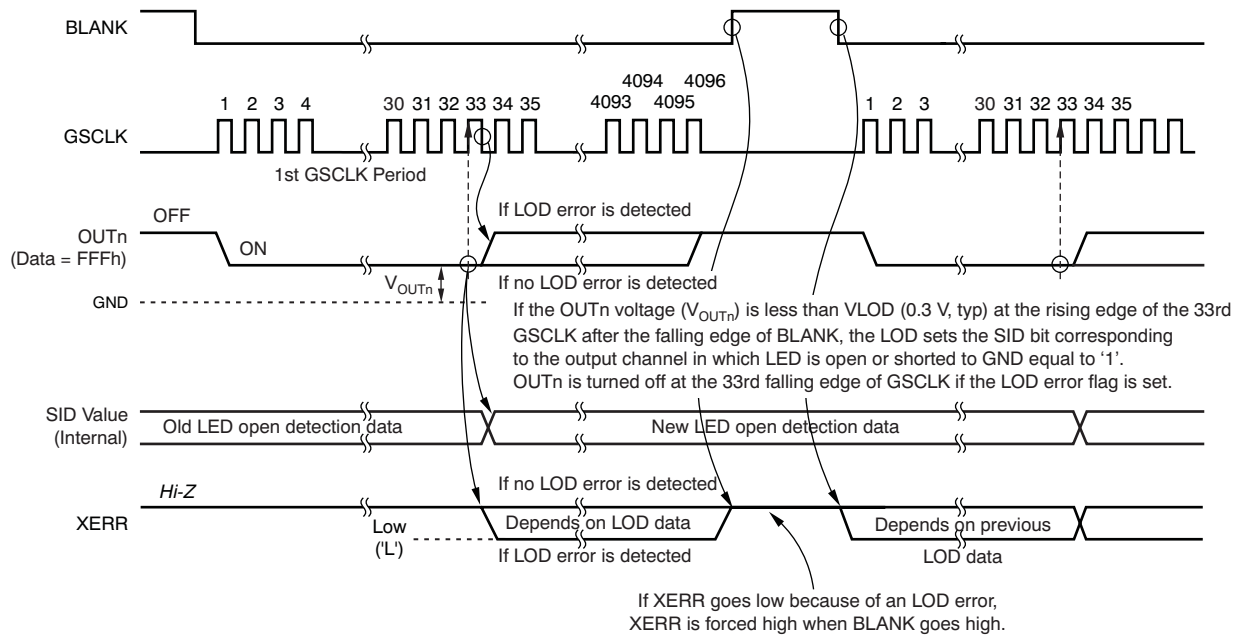

Figure 31. LED Open Detection (LOD) Timing

Thermal Shutdown and Thermal Error Flag

The thermal shutdown (TSD) function turns off all of the constant current outputs on the IC immediately when the junction temperature (T_J) exceeds the threshold ($T_{(TEF)} = +162^\circ\text{C}$, typ) and sets the thermal error flag (TEF) to '1'. All outputs are latched off when TEF is set to '1'; TEF and PTW remain off until the next grayscale cycle after T_J drops below ($T_{(TEF)} - T_{(HYST)}$). TEF is set to '0' once T_J drops below ($T_{(TEF)} - T_{(HYST)}$), but the output does not turn on until the first GSCLK after BLANK goes low while TEF is set to '0'. Figure 32 illustrates the TEF/TSD/XERR timing sequence.

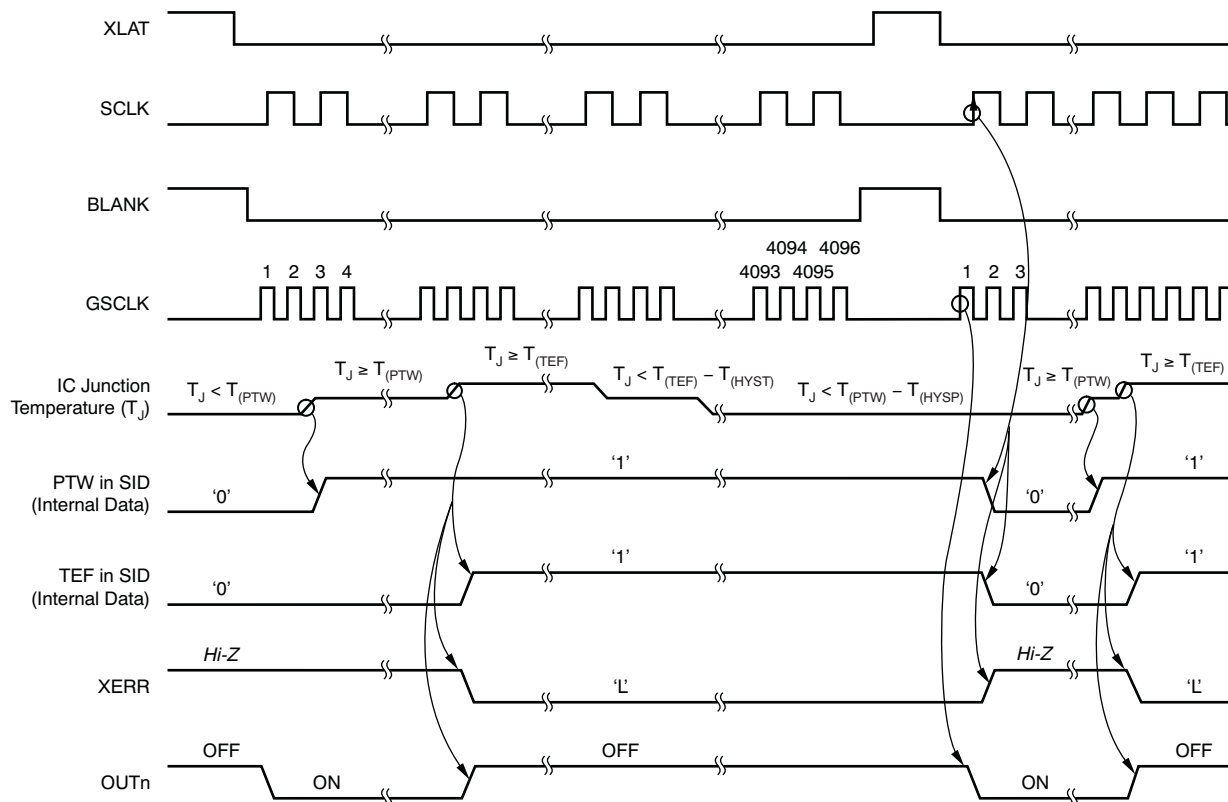

Figure 32. TEF/TSD/XERR Timing

Internal Pre-Charge FET

The internal pre-charge FET can prevent ghosting of multiplexed LED modules. One cause of this phenomenon is the charging current for parasitic capacitance of the constant current output line and driver through the LED. One of the mechanisms is shown in Figure 33.

In Figure 33, the constant current driver turns LED0-0 on at (1) and off at (2). After LED0-0 is turned off, OUT0 voltage is pulled up to V_{CHG} by LED0-0. This OUT0 node has some parasitic capacitance (such as the constant current driver output capacitance, and the board layout capacitance shown as C0-2). After LED0-0 turns off, SWPMOS0 is turned off and SWNMOS0 is turned on for LINE0, then LINE0 is pulled down to GND. Because there is a parasitic capacitance between LINE0 and OUT0, OUT0 voltage is also pulled down to GND. After that, SWPMOS1 is turned on for next line (LINE1). When SWPMOS1 turns on, OUT0 voltage is pulled up from the ground voltage to $V_{LED} - V_F$. The charge current (I_{CHRG}) flows to the parasitic capacitor (C0) through LED1-0, causing the LED to briefly turn on and creating the ghosting effect of LED1-0.

The TLC5944 has an internal pre-charge FET to prevent ghosting. The power supply of the pre-charge FET must be connected to V_{LED} (LED anode voltage). After a small delay after BLANK goes high, this FET pulls OUTn (OUT0 to OUT15) up to V_{LED} . The charge current does not flow to C0 through LED1-0 when SWMOS1 is turned on and the ghosting is eliminated at (3). The pre-charge FET turns off as soon as BLANK goes low to avoid current flowing from V_{LED} through the pre-charge FET.

Figure 33. LED Ghost-Lighting Phenomenon Mechanism

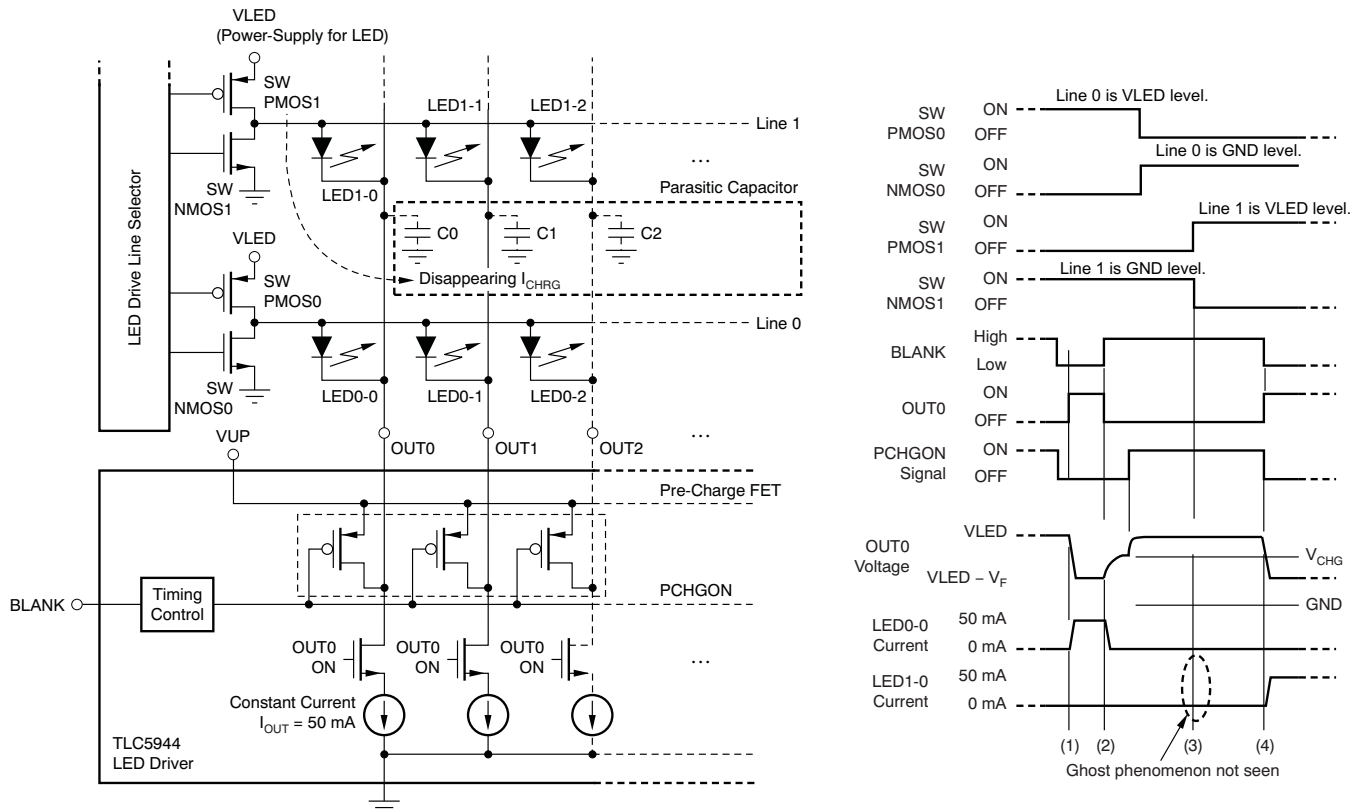

Figure 34. LED Ghost-Lighting Mechanism by Pre-Charge FET

Auto Output Off

The TLC5944 current consumption increases if any output (OUT_n) is turned on and no LED is connected, the LED is an open circuit, or the output is shorted to GND. The TLC5944 has the auto output off function to reduce consumption current in these cases. This function turns off any OUT_n where LED open has been detected to reduce the current into the VCC pin during error conditions. Figure 35 illustrates the auto output off function. Therefore, the LED anode voltage must be held over the LED forward voltage (V_F) plus the maximum voltage of the LED open detection threshold ($V_{LOD} = 0.4 V_{MAX}$) while the LED is on, in any case. Otherwise, the LED is forced off by the auto output off function.

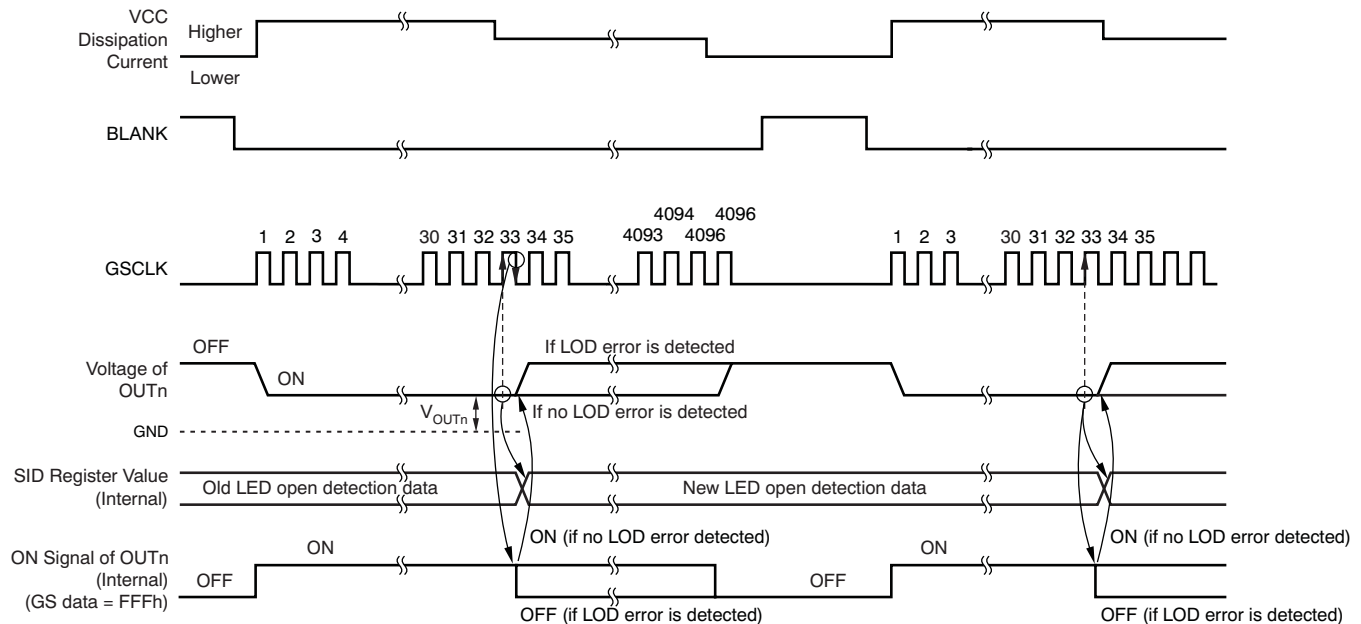

Figure 35. Auto Output Off Function

Noise Reduction

Large surge currents may flow through the IC and the printed circuit board (PCB) on which the device is mounted if all 16 LED channels turn on simultaneously at the start of each grayscale cycle. This large current surge could introduce detrimental noise and electromagnetic interference (EMI) into other circuits. The TLC5944 turns on the LED channels in a series delay to provide a circuit soft-start feature. The output current sinks are grouped into four groups of four channels each. The first group is OUT_{0/4/8/12}; the second group is OUT_{1/5/9/13}; the third group is OUT_{2/6/10/14}; and the fourth group is OUT_{3/7/11/15}. Each group is turned on sequentially with a small delay between groups; Figure 14 shows this delay. Both turn-on and turn-off are delayed.

POWER DISSIPATION CALCULATION

The device power dissipation must be below the power dissipation rate of the device package (illustrated in [Figure 18](#)) to ensure correct operation. [Equation 4](#) calculates the power dissipation of the device:

$$P_D = (V_{CC} \times I_{CC}) + \left[V_{OUT} \times I_{OLCmax} \times N \times \frac{DCn}{63d} \times d_{PWM} \right] \quad (4)$$

Where:

- V_{CC} = device supply voltage
- I_{CC} = device supply current
- V_{OUT} = OUTn voltage when driving LED current
- I_{MAX} = LED current adjusted by R_{IREF} resistor
- DCn = maximum DC value for OUTn
- N = number of OUTn driving LED at the same time
- d_{PWM} = duty ratio defined by BLANK pin or GS PWM value

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

PWP (R-PDSO-G28)

PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
