

## 2.7 V TO 5.5 V LOW POWER 12-BIT DIGITAL-TO-ANALOG CONVERTERS WITH INTERNAL REFERENCE AND POWER DOWN

### FEATURES

- 12-Bit Voltage Output DAC
- Programmable Internal Reference
- Programmable Settling Time vs Power Consumption
  - 1  $\mu$ s in Fast Mode
  - 3.5  $\mu$ s in Slow Mode
- 8-Bit  $\mu$ Controller Compatible Interface
- Differential Nonlinearity . . . <0.5 LSB Typ
- Voltage Output Range . . . 2x the Reference Voltage
- Monotonic Over Temperature

### APPLICATIONS

- Digital Servo Control Loops
- Digital Offset and Gain Adjustment
- Industrial Process Control
- Machine and Motion Control Devices
- Mass Storage Devices

### DESCRIPTION

The TLV5633 is a 12-bit voltage output digital- to-analog converter (DAC) with an 8-bit microcontroller compatible parallel interface. The 8 LSBs, the 4 MSBs, and 5 control bits are written using three different addresses. Developed for a wide range of supply voltages, the TLV5633 can be operated from 2.7 V to 5.5 V.

The resistor string output voltage is buffered by a x2 gain rail-to-rail output buffer. The buffer features a Class A (slow mode: AB) output stage to improve stability and reduce settling time. The programmable settling time of the DAC allows the designer to optimize speed versus power dissipation. With its on-chip programmable precision voltage reference, the TLV5633 simplifies overall system design. Because of its ability to source up to 1 mA, the internal reference can also be used as a system reference. The settling time and the reference voltage can be chosen by a control register.

Implemented with a CMOS process, the device is designed for single supply operation from 2.7 V to 5.5 V. It is available in 20-pin SOIC and TSSOP packages in standard commercial and industrial temperature ranges.

### AVAILABLE OPTIONS

T <sub>A</sub>	PACKAGE <sup>(1)</sup>	
	SOIC (DW)	TSSOP (PW)
0°C to 70°C	TLV5633CDW	TLV5633CPW
-40°C to 85°C	TLV5633IDW	TLV5633IPW

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at [www.ti.com](http://www.ti.com).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**FUNCTIONAL BLOCK DIAGRAM**

**Terminal Functions**

TERMINAL NAME	TERMINAL NO.	I/O/P	DESCRIPTION
A1, A0	7, 8	I	Address input
AGND	14	P	Ground
AV <sub>DD</sub>	11	P	Positive power supply (analog part)
$\overline{CS}$	18	I	Chip select. Digital input active low, used to enable/disable inputs
D0-D1	19, 20	I	Data input
D2-D7	1-6	I	Data input
DV <sub>DD</sub>	10	P	Positive power supply (digital part)
LDAC	16	I	Load DAC. Digital input active low, used to load DAC output
OUT	13	O	DAC analog voltage output
$\overline{PWR}$	15	I	Power down. Digital input active low
REF	12	I/O	Analog reference voltage input/output
SPD	9	I	Speed select. Digital input
$\overline{WE}$	17	I	Write enable. Digital input active low, used to latch data

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		UNIT
Supply voltage (DV <sub>DD</sub> , AV <sub>DD</sub> to AGND)		7 V
Supply voltage difference range, AV <sub>DD</sub> - DV <sub>DD</sub>		-2.8 V to 2.8 V
Reference input voltage range		-0.3 V to V <sub>DD</sub> + 0.3 V
Digital input voltage range		-0.3 V to V <sub>DD</sub> + 0.3 V
Operating free-air temperature range, T <sub>A</sub>	TLV5633C	0°C to 70°C
	TLV5633I	-40°C to 85°C
Storage temperature range, T <sub>stg</sub>		-65°C to 150°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
Supply voltage, DV <sub>DD</sub> , AV <sub>DD</sub>	5-V operation	4.5	5	5.5	V
	3-V operation	2.7	3	3.3	V
Supply voltage difference, $\Delta V_{DD} = AV_{DD} - DV_{DD}$		0	0	0	V
Power on reset voltage, POR		0.55		2	V
High-level digital input voltage, V <sub>IH</sub>	DV <sub>DD</sub> = 2.7 V	2			V
	DV <sub>DD</sub> = 5.5 V	2.4			
Low-level digital input voltage, V <sub>IL</sub>	DV <sub>DD</sub> = 2.7 V			0.6	V
	DV <sub>DD</sub> = 5.5 V			1	
Reference voltage, V <sub>ref</sub> to REF terminal (5-V supply) <sup>(1)</sup>		AGND	2.048	AV <sub>DD</sub> -1.5	V
Reference voltage, V <sub>ref</sub> to REF terminal (3-V supply) <sup>(1)</sup>		AGND	1.024	AV <sub>DD</sub> -1.5	V
Load resistance, R <sub>L</sub>		2			k $\Omega$
Load capacitance, C <sub>L</sub>				100	pF
Operating free-air temperature, T <sub>A</sub>	TLV5633C	0		70	°C
	TLV5633I	-40		85	

(1) Due to the x2 output buffer, a reference input voltage  $\geq AV_{DD}/2$  causes clipping of the transfer function. The output buffer of the internal reference must be disabled, if an external reference is used.

## ELECTRICAL CHARACTERISTICS

over recommended operating free-air temperature range,  $V_{ref} = 2.048\text{ V}$ ,  $V_{ref} = 1.024\text{ V}$  (unless otherwise noted)

POWER SUPPLY							
PARAMETER	TEST CONDITIONS			MIN	TYP	MAX	UNIT
$I_{DD}$ Power supply current	No load, All inputs = AGND or DV <sub>DD</sub> , DAC latch = 0x800	$AV_{DD} = 5\text{ V}$ , $DV_{DD} = 5\text{ V}$	REF on	Fast	2.3	2.8	mA
			REF on	Slow	1.3	1.6	mA
			REF off	Fast	1.9	2.4	mA
			REF off	Slow	0.9	1.2	mA
		$AV_{DD} = 3\text{ V}$ , $DV_{DD} = 3\text{ V}$	REF on	Fast	2.1	2.6	mA
			REF on	Slow	1.2	1.5	mA
			REF off	Fast	1.8	2.3	mA
			REF off	Slow	0.9	1.1	mA
Power down supply current				0.01	1	μA	
PSRR Power supply rejection ratio	Zero scale, external reference <sup>(1)</sup>			-60		dB	
	Full scale, external reference <sup>(2)</sup>			-60			
STATIC DAC SPECIFICATIONS							
Resolution				12		bits	
INL Integral nonlinearity, end point adjusted	$R_L = 10\text{ k}\Omega$ , $C_L = 100\text{ pF}$ <sup>(3)</sup>			±1.2	±3	LSB	
DNL Differential nonlinearity	$R_L = 10\text{ k}\Omega$ , $C_L = 100\text{ pF}$ <sup>(4)</sup>			±0.3	±0.5	LSB	
$E_{ZS}$ Zero-scale error (offset error at zero scale) <sup>(5)</sup>					20	mV	
$E_{ZS\text{TC}}$ Zero-scale-error temperature coefficient <sup>(6)</sup>					20	ppm/°C	
$E_G$ Gain error <sup>(7)</sup>					±0.3	% full scale V	
$E_G\text{TC}$ Gain error temperature coefficient <sup>(8)</sup>				20		ppm/°C	
OUTPUT SPECIFICATIONS							
$V_O$ Output voltage	$R_L = 10\text{ k}\Omega$				$AV_{DD}-0.4$	V	
Output load regulation accuracy	$V_O = 4.096\text{ V}$ , $2.048\text{ V}$ , $R_L = 2\text{ k}\Omega$				±0.29	% full scale V	

- (1) Power supply rejection ratio at zero scale is measured by varying  $AV_{DD}$  and is given by:  $PSRR = 20 \log [(E_{ZS}(AV_{DD\text{max}}) - E_{ZS}(AV_{DD\text{min}}))/AV_{DD\text{max}}]$
- (2) Power supply rejection ratio at full scale is measured by varying  $AV_{DD}$  and is given by:  $PSRR = 20 \log [(E_G(AV_{DD\text{max}}) - E_G(AV_{DD\text{min}}))/AV_{DD\text{max}}]$
- (3) The relative accuracy or integral nonlinearity (INL) sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors (see text).
- (4) The differential nonlinearity (DNL) sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
- (5) Zero-scale error is the deviation from zero voltage output when the digital input code is zero (see text).
- (6) Zero-scale-error temperature coefficient is given by:  $E_{ZS\text{TC}} = [E_{ZS}(T_{\text{max}}) - E_{ZS}(T_{\text{min}})]/2V_{ref} \times 10^6/(T_{\text{max}} - T_{\text{min}})$ .
- (7) Gain error is the deviation from the ideal output ( $2V_{ref} - 1\text{ LSB}$ ) with an output load of  $10\text{ k}\Omega$  excluding the effects of the zero-error.
- (8) Gain temperature coefficient is given by:  $E_G\text{TC} = [E_G(T_{\text{max}}) - E_G(T_{\text{min}})]/2V_{ref} \times 10^6/(T_{\text{max}} - T_{\text{min}})$ .

## ELECTRICAL CHARACTERISTICS (continued)

## APPLICATION INFORMATION

### GENERAL FUNCTION

The TLV5633 is a 12-bit, single supply DAC, based on a resistor string architecture. It consists of a parallel interface, a speed and power down control logic, a programmable internal reference, a resistor string, and a rail-to-rail output buffer. The output voltage (full scale determined by reference) is given by:

$$2 \text{ REF } \frac{\text{CODE}}{0 \times 1000} \text{ [V]}$$

Where REF is the reference voltage and CODE is the digital input value in the range 0x000 to 0xFFFF. A power on reset initially puts the internal latches to a defined state (all bits zero).

### PARALLEL INTERFACE

The device latches data on the positive edge of  $\overline{\text{WE}}$ . It must be enabled with  $\overline{\text{CS}}$  low. Whether the data is written to one of the DAC holding latches (MSW, LSW) or the control register depends on the address bits A1 and A0.  $\overline{\text{LDAC}}$  low updates the DAC with the value in the holding latch.  $\overline{\text{LDAC}}$  is an asynchronous input and can be held low, if a separate update is not necessary. However, to control the DAC using the load feature, there should be approximately a 5 ns delay after the positive  $\overline{\text{WE}}$  edge before driving  $\overline{\text{LDAC}}$  low. Two more asynchronous inputs, SPD and  $\overline{\text{PWR}}$  control the settling times and the power-down mode:

SPD:      Speed control      1 → fast mode                      0 → slow mode  
 $\overline{\text{PWR}}$ :    Power control            1 → normal operation            0 → power down

It is also possible to program the different modes (fast, slow, power down) and the DAC update latch using the control register. The following tables list the possible combinations of control signals and control bits.

PIN	BIT	MODE
SPD	SPD	
0	0	Slow
0	1	Fast
1	0	Fast
1	1	Fast

PIN	BIT	POWER
$\overline{\text{PWR}}$	PWD	
0	0	Down
0	1	Down
1	0	Normal
1	1	Down

PIN	BIT	LATCH
$\overline{\text{LDAC}}$	RLDAC	
0	0	Transparent
0	1	Transparent
1	0	Hold
1	1	Transparent

## DATA FORMAT

The TLV5633 writes data either to one of the DAC holding latches or to the control register depending on the address bits A1 and A0.

### ADDRESS BITS

A1	A0	REGISTER
0	0	DAC LSW holding
0	1	DAC MSW holding
1	0	Reserved
1	1	Control

The following table lists the meaning of the bits within the control register.

D7	D6	D5	D4	D3	D2	D1	D0
X	X	X	REF1	REF0	RLDAC	PWR	SPD
X <sup>(1)</sup>	X <sup>(1)</sup>	X <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>

(1) Default values: X = Don't Care

SPD: Speed control bit    1 → fast mode                    0 → slow mode

PWR: Power control bit    1 → power down                    0 → normal operation

RLDAC: Load DAC latch    1 → latch transparent    0 → DAC latch controlled by  $\overline{\text{LDAC}}$  pin

REF1 and REF0 determine the reference source and the reference voltage.

### REFERENCE BITS

REF1	REF0	REFERENCE
0	0	External
0	1	1.024 V
1	0	2.048 V
1	1	External

If an external reference voltage is applied to the REF pin, external reference must be selected.

## LAYOUT CONSIDERATIONS

To achieve the best performance, it is recommended to have separate power planes for GND,  $AV_{DD}$ , and  $DV_{DD}$ . Figure 13 shows how to lay out the power planes for the TLV5633. As a general rule, digital and analog signals should be separated as wide as possible. To avoid crosstalk, analog and digital traces must not be routed in parallel. The two positive power planes ( $AV_{DD}$  and  $DV_{DD}$ ) should be connected together at one point with a ferrite bead.

A 100-nF ceramic low series inductance capacitor between  $DV_{DD}$  and GND and a 1- $\mu$ F tantalum capacitor between  $AV_{DD}$  and GND placed as close as possible to the supply pins are recommended for optimal performance.

**Figure 13. TLV5633 Board Layout**

### LINEARITY, OFFSET, AND AGAIN ERROR USING SINGLE END SUPPLIES

When an amplifier is operated from a single supply, the voltage offset can still be either positive or negative. With a positive offset, the output voltage changes on the first code change. With a negative offset the output voltage may not change with the first code, depending on the magnitude of the offset voltage.

The output amplifier attempts to drive the output to a negative voltage. However, because the most negative supply rail is ground, the output cannot drive below ground and clamps the output at 0 V.

The output voltage remains at zero until the input code value produces a sufficient positive output voltage to overcome the negative offset voltage, resulting in the transfer function shown in [Figure 14](#).

**Figure 14. Effect of Negative Offset (Single Supply)**

The offset error, not the linearity error, produces this breakpoint. The transfer function would have followed the dotted line if the output buffer could drive below the ground rail.

For a DAC, linearity is measured between zero input code (all inputs 0) and full scale code (all inputs 1) after offset and full scale are adjusted out or accounted for in some way. However, single supply operation does not allow for adjustment when the offset is negative due to the breakpoint in the transfer function. So the linearity is measured between full scale code and the lowest code that produces a positive output voltage.

### TLV5633 INTERFACED to an Intel MCS<sup>®</sup>51 Controller

The circuit in Figure 15 shows how to interface the TLV5633 to an Intel MCS<sup>®</sup>51 microcontroller. The address bus and the data bus of the controller are multiplexed on port 0 (non page mode) to save port pins. To separate the address bits and the data bits, the controller provides a dedicated signal, address latch enable (ALE), which is connected to a latch at port 0.

An address decoder is required to generate the chip select signal for the TLV5633. In this example, a simple 3-to-8 decoder (74AC138) is used for the interface as shown in Figure 15. The DAC is memory mapped at addresses 0x8000/1/2/3 within the data memory address space and mirrored every 32 address locations (0x8020/1/2/3, 0x8040/1/2/3, etc.). In a typical microcontroller system, programmable logic should be used to generate the chip select signals for the entire system.

The data pins and the  $\overline{WE}$  pin of the TLV5633 can be connected directly to the multiplexed address and data bus and the  $\overline{WR}$  signal of the controller.

The application uses the TLV5633 device's internal reference at 2.048 V. The  $\overline{LDAC}$  pin is connected to P3.5 and is used to update the DAC after both data bytes have been written.

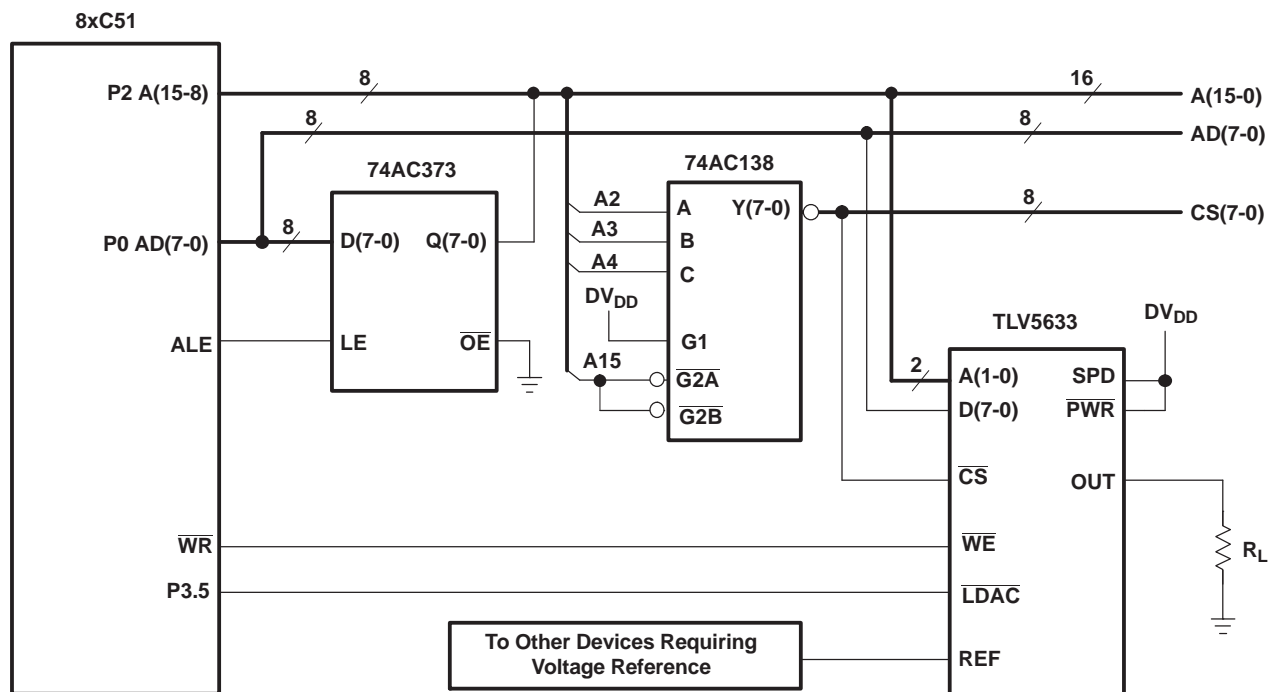

Figure 15. TLV5633 Interfaced to an Intel MCS<sup>®</sup>51 Controller

## SOFTWARE

In the following example, the code generates a waveform at 20 KSPS with 32 samples stored in a table within the program memory space of the microcontroller.

The waveform data is located in the program memory space at segment SINTBL beginning with the MSW of the first 16-bit word (the 4 MSBs are ignored), followed by the LSW. Two bytes are required for each DAC word (the table is not shown in the code example).

The program consists of two parts:

- A main routine, which is executed after reset and which initializes the timer and the interrupt system of the microcontroller.
- An interrupt service routine, which reads a new value from the waveform table and writes it to the DAC.

## DEFINITIONS OF SPECIFICATIONS AND TERMINOLOGY

### **Integral Nonlinearity (INL)**

The relative accuracy or integral nonlinearity (INL), sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.

### **Differential Nonlinearity (DNL)**

The differential nonlinearity (DNL), sometimes referred to as differential error, is the difference between the measured and ideal 1-LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.

### **Zero-Scale Error ( $E_{ZS}$ )**

Zero-scale error is defined as the deviation of the output from 0 V at a digital input value of 0.

### **Gain Error ( $E_G$ )**

Gain error is the error in slope of the DAC transfer function.

### **Signal-To-Noise Ratio + Distortion (SINAD)**

Signal-to-noise ratio + distortion is the ratio of the rms value of the output signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

### **Spurious Free Dynamic Range (SFDR)**

Spurious free dynamic range is the difference between the rms value of the output signal and the rms value of the spurious signal within a specified bandwidth. The value for SFDR is expressed in decibels.

### **Total Harmonic Distortion (THD)**

Total harmonic distortion is the ratio of the rms sum of the first six harmonic components to the rms value of the fundamental signal and is expressed in decibels.

### Revision history

Revision	Date	Description
A	01/2001	Minor typographical changes.
B	08/2003	Changed the High-level and Low-level digital input voltage in the <i>Recommended Operating Conditions</i> table.
C	09/2006	Changed the positions of LSW and MSW in <a href="#">Figure 2</a> and <a href="#">Figure 3</a> .

**PACKAGING INFORMATION**

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

 C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.  
 D. Falls within JEDEC MO-153

DW (R-PDSO-G20)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
  - D. Falls within JEDEC MS-013 variation AC.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
