

## HIGH POWER WHITE LED DRIVER 2-MHz SYNCHRONOUS BOOST CONVERTER WITH STANDARD LOGIC INTERFACE

### FEATURES

- **Four Operational Modes**
  - Torch and Flash up to  $I_{LED} = 700\text{ mA}$
  - Voltage-Regulated Boost Converter: **5.0 V**
  - Shutdown: **0.3  $\mu\text{A}$  (typ)**
- **Total Solution Circuit Area < 25 mm<sup>2</sup>**
- **Up to 96% Efficiency**
- **Integrated LED Turn-On Safety Timer**
- **Zero Latency TX-Masking Input**
- **Integrated Low Light Dimming Mode**
- **LED Disconnect During Shutdown**
- **Open/Shorted LED Protection**
- **Over-Temperature Protection**
- **Available in a 12-Pin NanoFree™ (CSP) and 10-Pin QFN Packaging**

### APPLICATIONS

- **Camera White LED Torch/Flash for Cell Phones, Smart-Phones and PDAs**
- **General Lighting Applications**
- **Audio Amplifier Power Supply**

### DESCRIPTION

The TPS6105x device uses a high-frequency synchronous-boost topology with constant current sink to drive single white LEDs. The device uses an inductive fixed-frequency PWM control scheme using small external components, minimizing input ripple current.

The 2-MHz switching frequency allows the use of small and low-profile 2.2- $\mu\text{H}$  inductors. To optimize overall efficiency, the device operates with only a 250-mV LED feedback voltage.

The TPS6105x device not only operates as a regulated current source, but also as a standard voltage-boost regulator. This additional operating mode can be useful to supply other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

The LED current or the desired output voltage can be programmed via two logic signals (MODE0/1). To simplify flash synchronization with the camera module, the device offers a trigger pin (FLASH\_SYNC) for fast LED turn-on time.

When the TPS6105x is not in use, it can be put into shutdown mode, reducing the input current to 0.3  $\mu\text{A}$  (typ). During shutdown, the LED pin is high impedance to avoid leakage current through the LED.

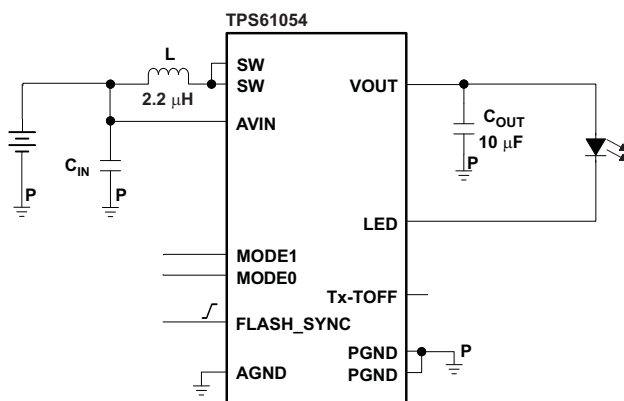

Figure 1. Typical Application

Figure 2. Typical PC-Board Layout

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## AVAILABLE OPTIONS

| PART NUMBER <sup>(1)(2)</sup> | TORCH CURRENT <sup>(3)</sup> | FLASH CURRENT <sup>(3)</sup> | SAFETY TIMER MAXIMUM DURATION | CURRENT LIMIT       | PACKAGE MARKING | PACKAGE |
|-------------------------------|------------------------------|------------------------------|-------------------------------|---------------------|-----------------|---------|
| TPS61054DRC                   | 75 mA                        | 700 mA                       | 820 ms                        | 1500 mA (ILIM = 01) | BRX             | QFN-10  |
| TPS61055DRC                   | 75 mA                        | 500 mA                       | 820 ms                        | 1000 mA (ILIM = 00) | BRY             | QFN-10  |

- All devices are specified for operation in the commercial temperature range,  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .
- The YZG package is available in tape and reel. Add R suffix (TPS6105xYZGR, TPS6105xDRCR) to order quantities of 3000 parts. Add T suffix (TPS6105xYZGT, TPS6105xDRCT) to order quantities of 250 parts.
- For customized current settings, please contact the factory.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|   |  | TPS6105X   | UNIT               |
|---|--|------------|--------------------|
| Voltage range on AVIN, VOUT, SW, LED <sup>(2)</sup>               |  | -0.3 to 7  | V                  |
| Voltage range on MODE0, MODE1, FLASH_SYNC, Tx-TOFF <sup>(2)</sup> |  | -0.3 to 7  | V                  |
| $T_A$   | Operating ambient temperature range <sup>(3)</sup> | -40 to 85  | $^{\circ}\text{C}$ |
| $T_{J(\text{MAX})}$   | Maximum operating junction temperature             | 150        | $^{\circ}\text{C}$ |
| $T_{\text{stg}}$  | Storage temperature range                          | -65 to 150 | $^{\circ}\text{C}$ |
| ESD rating <sup>(4)</sup>   | Human body model                                   | 2          | kV                 |
|   | Charge device model                                | 1          | kV                 |
|   | Machine model                                      | 200        | V                  |

- Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values are with respect to network ground terminal.
- In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature ( $T_{A(\text{max})}$ ) is dependent on the maximum operating junction temperature ( $T_{J(\text{max})}$ ), the maximum power dissipation of the device in the application ( $P_{D(\text{max})}$ ), and the junction-to-ambient thermal resistance of the part/package in the application ( $\theta_{JA}$ ), as given by the following equation:  $T_{A(\text{max})} = T_{J(\text{max})} - (\theta_{JA} \times P_{D(\text{max})})$ .
- The human body model is a 100-pF capacitor discharged through a 1.5-k $\Omega$  resistor into each pin. The machine model is a 200-pF capacitor discharged directly into each pin.

## DISSIPATION RATINGS

| PACKAGE | THERMAL RESISTANCE <sup>(1) (2)</sup>       |  | POWER RATING<br>$T_A = 25^{\circ}\text{C}$ | DERATING FACTOR<br>ABOVE <sup>(1) (2)</sup> $T_A = 25^{\circ}\text{C}$ |
|---------|---|--|--|--|
|         | $\theta_{JA} = 89^{\circ}\text{C}/\text{W}$ | $\theta_{JB} = 35^{\circ}\text{C}/\text{W}$  |  |  |
| YZG     | $\theta_{JA} = 89^{\circ}\text{C}/\text{W}$ | $\theta_{JB} = 35^{\circ}\text{C}/\text{W}$  | 1.1 W                                      | 12 mW/ $^{\circ}\text{C}$  |
| DRC     | $\theta_{JA} = 49^{\circ}\text{C}/\text{W}$ | $\theta_{JC} = 3.2^{\circ}\text{C}/\text{W}$ | 2.4 W                                      | 20 mW/ $^{\circ}\text{C}$  |

- Measured with high-K board.
- Maximum power dissipation is a function of  $T_{J(\text{max})}$ ,  $\theta_{JA}$  and  $T_A$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_{J(\text{max})} - T_A) / \theta_{JA}$ .

## ELECTRICAL CHARACTERISTICS

Unless otherwise noted the specification applies for  $V_{IN} = 3.6\text{ V}$  over an operating junction temp. of  $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$ . Typical values are for  $T_A = 25^{\circ}\text{C}$ .

DETAILED DESCRIPTION

OPERATION

The TPS6105x family employs a 2-MHz constant-frequency, current-mode PWM converter to generate the output voltage required to drive high-power LEDs. The device integrates a power stage based on an NMOS switch and a synchronous NMOS rectifier. The device also implements a linear low-side current regulator to control the LED current when the battery voltage is higher than the diode forward voltage.

In boost mode, the duty cycle of the converter is set by the error amplifier and the saw-tooth ramp applied to the comparator. Because the control architecture is based on a current-mode control, a compensation ramp is added to allow stable operation at duty cycles larger than 50%. The converter is a fully-integrated synchronous-boost converter, always operating in continuous-conduction mode. This allows low-noise operation, and avoids ringing on the switch pin, which would be seen on a converter when entering discontinuous-conduction mode.

The TPS6105x device not only operates as a regulated current source but also as a standard voltage-boost regulator. This additional operating mode can be useful to properly synchronize the converter when supplying other high-power devices in the system, such as a hands-free audio power amplifier, or any other component requiring a supply voltage higher than the battery voltage.

The mode of operation (shutdown, torch and flash modes, constant voltage regulation) selection is done via the MODE0/1 control inputs.

Table 2. TPS6105x Operating Modes

| MODE1 | MODE0 | OPERATING MODES  |
|-------|-------|--|
| 0     | 0     | Power stage is in shutdown. The output is either connected directly to the battery via the rectifier's body diode.   |
| 0     | 1     | LED is turned-on for torch light operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED. |
| 1     | 0     | LED is turned-on for flashlight operation. The converter is operating in the current regulation mode (CM). The output voltage is controlled by the forward voltage characteristic of the LED.  |
| 1     | 1     | LED is turned-off and the converter is operating in voltage regulation mode (VM). The output voltage is regulated to 5.0V.   |

To simplify flash synchronization with the camera module, the device offers a FLASH\_SYNC strobe input pin to switch (with zero latency) the LED current from flash to torch light. The LED is driven at the flashlight current level when a logic high signal is applied to the FLASH\_SYNC pin.

The maximum duration of the flash pulse can be limited by means of an internal safety timer (820ms). The safety timer starts on the rising edge of the FLASH\_SYNC signal and stops either on its falling edge or after a timeout whatever occurs first.

Figure 25. Level Sensitive Safety Timer (Timeout)

Figure 26. Level Sensitive Safety Timer (Normal Operation + Timeout)

## EFFICIENCY

The sense voltage has a direct effect on the converter's efficiency. Because the voltage across the low-side current regulator does not contribute to the output power (LED brightness), the lower the sense voltage, the higher the efficiency will be.

When running in boost mode ( $V_{F(LED)} > V_{IN}$ ), the voltage present at the LED pin of the low-side current regulator is typically 250 mV, which contributes to high power-conversion efficiency.

When running in the linear down-converter mode ( $V_{F(LED)} < V_{IN}$ ), the low-side current regulator drops the voltage difference between the input voltage and the LED forward voltage. Depending on the input voltage and the LED forward voltage characteristic, the converter displays efficiency of approximately 80% to 90%.

## FLASH BLANKING

The TPS6105x device also integrates a Tx-TOFF input that can be used as flash masking input. This blanking function turns the LED from flash to torch light, thereby reducing almost instantaneously the peak current loading from the battery. This function has no influence on the safety timer duration.

**Figure 27. Synchronized Flash With Blanking Periods (MODE0 = 0, MODE1 = 1)**

## LOW LIGHT DIMMING MODE

The TPS6105x device features white LED drive capability at very low light intensity. To generate a reduced LED average current, the device employs a 122 Hz fixed frequency PWM modulation scheme. Operation is understood best by referring to the timer block diagram.

The torch current is modulated with a 6.3% duty cycle. The low light dimming mode can only be activated in the torch only mode (MODE1 = 0, MODE0 = 1) together with a logic level high applied to the FLASH\_SYNC input.

**Figure 28. PWM Dimming Principle**

White-LED blinking can be achieved by turning on/off periodically the LED dimmer via the (DIM) bit, see [Figure 29](#).

**Figure 29. White LED Blinking Control (MODE1 = 0, FLASH\_SYNC = 1)**

## SOFT-START

Since the output capacitor always remains biased to the input voltage, the TPS6105x can immediately start switching once it has been enabled. The device starts-up by smoothly ramping up its internal reference voltage, thus limiting the inrush current.

## SHUTDOWN

In shutdown mode, the regulator stops switching and the LED pin is high impedance thus eliminating any DC conduction path. The internal switch and rectifier MOSFET are turned off. VOUT is one body-diode drop below the input voltage and the device consumes only a shutdown current of 0.3  $\mu$ A (typ). The output capacitor remains biased to the input voltage.

## LED FAILURE MODES

If the LED fails as a short circuit, the low-side current regulator limits the maximum output current.

If the LED fails as an open circuit, the control loop initially attempts to regulate off of its low-side current regulator feedback signal. This drives VOUT higher. Because the open-circuited LED will never accept its programmed current, VOUT must be voltage-limited by means of a secondary control loop. In this failure mode, the TPS6105x limits VOUT to 6.0 V (typ.).

## UNDERVOLTAGE LOCKOUT

The undervoltage lockout circuit prevents the device from malfunctioning at low input voltages. It prevents the converter from turning on the switch or rectifier MOSFET under undefined conditions.

## THERMAL SHUTDOWN

As soon as the junction temperature,  $T_J$ , exceeds 160°C typical, the device goes into thermal shutdown. In this mode, the *boost* power stage and the low-side current regulator are turned off. To resume operation, the device needs to be cycled through a shutdown phase (MODE0 = 0, MODE1 = 0).

## APPLICATION INFORMATION

### INDUCTOR SELECTION

A boost converter requires two main passive components for storing energy during the conversion. A boost inductor and a storage capacitor at the output are required. The TPS6105x device integrates a current limit protection circuitry. The peak current of the NMOS switch is sensed to limit the maximum current flowing through the switch and the inductor (e.g. 1000 mA or 1500 mA).

In order to optimize solution size the TPS6105x device has been designed to operate with inductance values between a minimum of 1.3  $\mu\text{H}$  and maximum of 2.9  $\mu\text{H}$ . In typical high-current white LED applications a 2.2  $\mu\text{H}$  inductance is recommended.

To select the boost inductor, it is recommended to keep the possible peak inductor current below the current limit threshold of the power switch in the chosen configuration. The highest peak current through the inductor and the power switch depends on the output load, the input and output voltages. Estimation of the maximum average inductor current and the maximum inductor peak current can be done using [Equation 1](#) and [Equation 2](#):

$$I_L \approx I_{\text{OUT}} = \frac{V_{\text{OUT}}}{\eta \times V_{\text{IN}}} \quad (1)$$

$$I_{L(\text{PEAK})} = \frac{V_{\text{IN}} \times D}{2 \times f \times L} + \frac{I_{\text{OUT}}}{(1 - D) \times \eta} \quad \text{with } D = \frac{V_{\text{OUT}} - V_{\text{IN}}}{V_{\text{OUT}}} \quad (2)$$

with:

f = switching frequency (2 MHz)

L = inductance value (2.2  $\mu\text{H}$ )

$\eta$  = estimated efficiency (85%)

For example, for an output current of 500 mA at 5 V, the TPS6105x device needs to be set for a 1000 mA current limit operation together with an inductor supporting this peak current.

The losses in the inductor caused by magnetic hysteresis losses and copper losses are a major parameter for total circuit efficiency.

**Table 3. List of Inductors**

| MANUFACTURER | SERIES    | DIMENSIONS                           | I <sub>LIM</sub> SETTINGS |
|--------------|-----------|--------------------------------------|---------------------------|
| TDK          | VLF3010AT | 2,6 mm × 2,8 mm × 1,0 mm max. height | 1000 mA (typ.)            |
| TAIYO YUDEN  | NR3010    | 3,0 mm × 3,0 mm × 1,0 mm max. height |                           |
| FDK          | MIPSA2520 | 2,5 mm × 2,0 mm × 1,2 mm max. height |                           |
| TDK          | VLF3014AT | 2,6 mm × 2,8 mm × 1,4 mm max. height | 1500 mA (typ.)            |
| COILCRAFT    | LPS3015   | 3,0 mm × 3,0 mm × 1,5 mm max. height |                           |
| MURATA       | LQH3NP    | 3,0 mm × 3,0 mm × 1,5 mm max. height |                           |
| TOKO         | FDSE0312  | 3,0 mm × 3,0 mm × 1,2 mm max. height |                           |

## CAPACITOR SELECTION

### Input Capacitor

For good input voltage filtering low ESR ceramic capacitors are recommended. A 10- $\mu$ F input capacitor is recommended to improve transient behavior of the regulator and EMI behavior of the total power supply circuit. The input capacitor should be placed as close as possible to the input pin of the converter.

### Output Capacitor

The primary parameter necessary to define the output capacitor is the maximum allowed output voltage ripple of the converter. This ripple is determined by two parameters of the capacitor, the capacitance and the ESR. It is possible to calculate the minimum capacitance needed for the defined ripple, supposing that the ESR is zero, by using [Equation 3](#):

$$C_{\min} \approx \frac{I_{\text{OUT}} \times (V_{\text{OUT}} - V_{\text{IN}})}{f \times \Delta V \times V_{\text{OUT}}} \quad (3)$$

Parameter  $f$  is the switching frequency and  $\Delta V$  is the maximum allowed ripple.

With a chosen ripple voltage of 10mV, a minimum capacitance of 10  $\mu$ F is needed. The total ripple is larger due to the ESR of the output capacitor. This additional component of the ripple can be calculated using [Equation 4](#):

$$\Delta V_{\text{ESR}} = I_{\text{OUT}} \times R_{\text{ESR}}$$

The total ripple is the sum of the ripple caused by the capacitance and the ripple caused by the ESR of the capacitor. Additional ripple is caused by load transients. This means that the output capacitor has to completely supply the load during the charging phase of the inductor. A reasonable value of the output capacitance depends on the speed of the load transients and the load current during the load change.

For the high current white LED application, a minimum of 3  $\mu$ F effective output capacitance is usually required when operating with 2.2  $\mu$ H (typ) inductors. For solution size reasons, this is usually one or more X5R/X7R ceramic capacitors. For stable operation of the internally compensated control loop, a maximum of 50  $\mu$ F effective output capacitance is tolerable.

Depending on the material, size and margin to the rated voltage of the used output capacitor, degradation on the effective capacitance can be observed. This loss of capacitance is related to the DC bias voltage applied. It is therefore always recommended to check that the selected capacitors are showing enough effective capacitance under real operating conditions.

## CHECKING LOOP STABILITY

The first step of circuit and stability evaluation is to look from a steady-state perspective at the following signals:

- Switching node, SW
- Inductor current,  $I_L$
- Output ripple voltage,  $V_{\text{OUT(AC)}}$

These are the basic signals that need to be measured when evaluating a switching converter. When the switching waveform shows large duty cycle jitter or the output voltage or inductor current shows oscillations the regulation loop may be unstable. This is often a result of board layout and/or L-C combination.

The next step in regulation loop evaluation is to perform a load transient test. Output voltage settling time after the load transient event is a good estimate of the control loop bandwidth. The amount of overshoot and subsequent oscillations (ringing) indicates the stability of the control loop. Without any ringing, the loop has usually more than 45° of phase margin.

Because the damping factor of the circuitry is directly related to several resistive parameters (e.g., MOSFET  $r_{\text{DS(on)}}$ ) that are temperature dependant, the loop stability analysis has to be done over the input voltage range, output current range, and temperature range.

## LAYOUT CONSIDERATIONS

As for all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground tracks.

The input capacitor, output capacitor, and the inductor should be placed as close as possible to the IC. Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at any place close to one of the ground pins of the IC.

To lay out the control ground, it is recommended to use short traces as well, separated from the power ground traces. This avoids ground shift problems, which can occur due to superimposition of power ground current and control ground current.

## THERMAL INFORMATION

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependant issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are listed below:

- Improving the power dissipation capability of the PCB design
- Improving the thermal coupling of the component to the PCB
- Introducing airflow in the system

Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design. The maximum junction temperature ( $T_J$ ) of the TPS6105x is 150°C.

The maximum power dissipation gets especially critical when the device operates in the linear down mode at high LED current. For single pulse power thermal analysis (e.g., flash strobe), the allowable power dissipation for the device is given by [Figure 30](#).

## THERMAL PAD MECHANICAL DATA

DRC (S-PVSON-N10)

PLASTIC SMALL OUTLINE NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

YZG (R-XBGA-N12)

DIE-SIZE BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. NanoFree™ package configuration.
  - $\triangle D$  Devices in YZG package can have dimension D ranging from 1.94 to 2.65 mm and dimension E ranging from 1.44 to 2.15 mm. To determine the exact package size of a particular device, refer to the device datasheet or contact a local TI representative.
  - E. Reference Product Data Sheet for array population.  
4 x 3 matrix pattern is shown for illustration only.
  - F. This package contains lead-free balls.  
Refer to YEG (Drawing #4204182) for tin-lead (SnPb) balls.

NanoFree is a trademark of Texas Instruments.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
