

Product Features

- 50 – 4000 MHz
- 18 dB Gain @ 900 MHz
- +34 dBm P1dB
- +46 dBm Output IP3
- High Drain Efficiency
- Single Voltage Supply
- Robust 1000V ESD, Class IC
- Lead free/green/RoHS-compliant 6mm 28-pin QFN package

Applications

- Mobile Infrastructure
- CATV / DBS
- W-LAN / ISM
- RFID
- Defense / Homeland Security
- Fixed Wireless

Specifications

DC Parameter	Units	Min	Typ	Max
Saturated Drain Current, I_{dss}	mA		1170	
Transconductance, G_m	mS		590	
Pinch Off Voltage, $V_p^{(1)}$	V		-2.0	

RF Parameter ⁽²⁾	Units	Min	Typ	Max
Operational Bandwidth	MHz	50		4000
Test Frequency	MHz		800	
Small Signal Gain	dB		18	
Maximum Stable Gain	dB		24	
Output P1dB	dBm		+34	
Output IP3 ⁽³⁾	dBm		+46	
Noise Figure	dB		3.5	

1. Pinch-off voltage is measured when $I_{ds} = 4.8$ mA.
2. Test conditions unless otherwise noted: $T = 25^\circ\text{C}$, $V_{DS} = 9$ V, $I_{DQ} = 450$ mA, in a tuned application circuit with $Z_L = Z_{LOPT}$, $Z_S = Z_{SOPT}$ (optimized for output power).
3. 3OIP measured with two tones at an output power of +18 dBm/tone separated by 1 MHz. The suppression on the largest IM3 product is used to calculate the 3OIP using a 2:1 rule.

Absolute Maximum Rating

Parameter	Rating
Storage Temperature	-55 to +125 °C
DC Power	7.5 W
RF Input Power (continuous)	6 dB above Input P1dB
Drain to Gate Voltage, V_{dg}	+16 V
Thermal Resistance, R_{th}	18°C/W
Junction Temperature	+160°C

Operation of this device above any of these parameters may cause permanent damage.

Product Description

The FP31QF is a high performance 2-Watt HFET (Heterostructure FET) in a low-cost lead-free/RoHS-compliant 28-pin 6x6 mm QFN (Quad Flatpack, No-Lead) surface-mount package. This device works optimally at a drain bias of +9 V and 450 mA to achieve +46 dBm output IP3 performance and an output power of +34 dBm at 1-dB compression.

The device conforms to WJ Communications' long history of producing high reliability and quality components. The FP31QF has an associated MTTF of a minimum of 100 years at a mounting temperature of 85°C. All devices are 100% RF & DC tested.

The product is targeted for use as driver amplifiers for wireless infrastructure where high performance and high efficiency are required.

Not Recommended for New Designs

Recommended Replacement Part: TQP7M9104

Functional Diagram

Function	Pin No.
Gate / RF Input	3
Drain / RF Output	19
Ground	All other pins & backside copper

Typical Performance⁽⁴⁾

Parameter	Units	Typical			
Frequency	MHz	915	1960	2140	2450

S22	dB	-12	-11	-24	-15
Output P1dB	dBm	+34	+33.8	+33.2	+33.5
Output IP3 ⁽³⁾	dBm	+46	+46.8	+46.6	+46.8
Noise Figure	dB	3.5	4.5	4.6	4.6
IS-95 Channel Power @ -45 dBc ACPR	dBm	+27.8	+27.3		
W-CDMA Ch. Power @ -45 dBc ACLR	dBm			+25	
Drain Voltage ⁽⁵⁾	V		+9		
Drain Current ⁽⁵⁾	mA		450		

4. Typical parameters represent performance in an application circuit.
5. Empirical measurements showed optimal power performance at a drain voltage = 9 volts at 450 mA. Because the FP31QF is a discrete device, users can choose their own bias configuration. Performance may vary from the data shown depending on the biasing conditions. To achieve a minimum 1 million hours MTTF rating, the biasing condition should maintain a junction temperature below 160 °C over all operating temperatures. This can be approximated by (drain voltage) x (drain current) x 17.5 °C/W + (maximum operating temperature).

2110 – 2170MHz Application Circuit Performance Plots

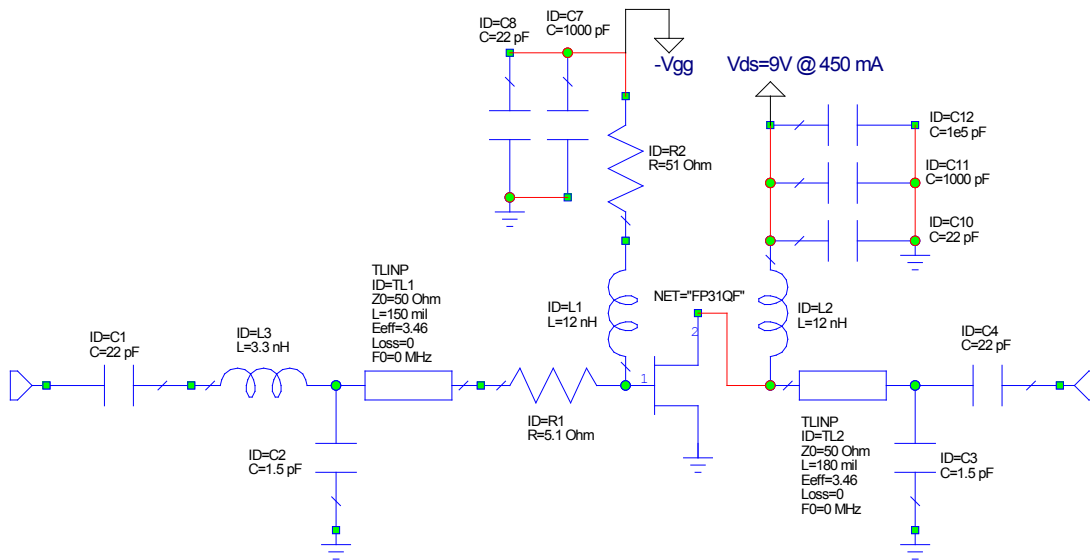

Reference Design: 2400 – 2500 MHz

The application circuit is matched for output power.

Typical RF Performance Drain Bias = +9 V, $I_{ds} = 450$ mA, 25 °C

Frequency	MHz	2400	2500
S21 – Gain	dB	12.1	12.0
S11 – Input Return Loss	dB	-13	-16
S22 – Output Return Loss	dB	-13	-17
Output P1dB	dBm	+33.5	
Output IP3 (+18 dBm / tone, 1 MHz spacing)	dBm	+46.8	
Noise Figure	dB	4.6	

The 2.4 – 2.5 GHz Reference Circuit is shown for design purposes only. An evaluation board is not readily available for this application. The reader can obtain any FP31QF evaluation board and modify it with the circuit shown to achieve the performance shown in this reference design.

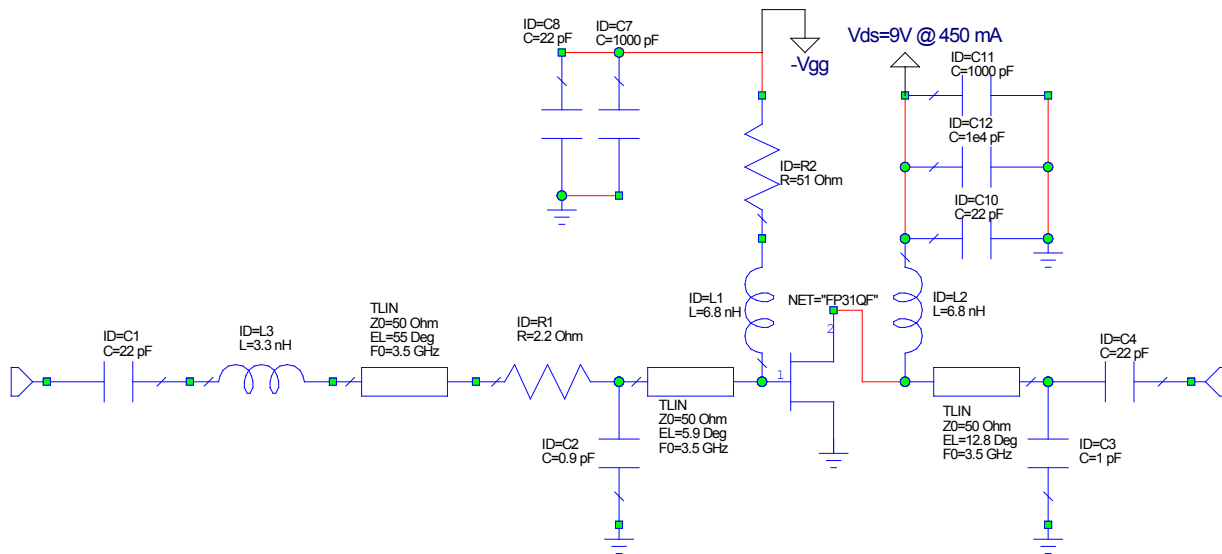

Reference Design: 3500 MHz

The application circuit is matched for output power.

Typical RF Performance Drain Bias = +9 V, $I_{ds} = 450$ mA, 25 °C

Frequency	MHz	3500
S21 – Gain	dB	11.9
S11 – Input Return Loss	dB	-16
S22 – Output Return Loss	dB	-8.8
Output P1dB	dBm	+33.5
Output IP3 (+18 dBm / tone, 1 MHz spacing)	dBm	+45

The 3.5 GHz Reference Circuit is shown for design purposes only. An evaluation board is not readily available for this application. The reader can obtain any FP31QF evaluation board and modify it with the circuit shown to achieve the performance shown in this reference design.

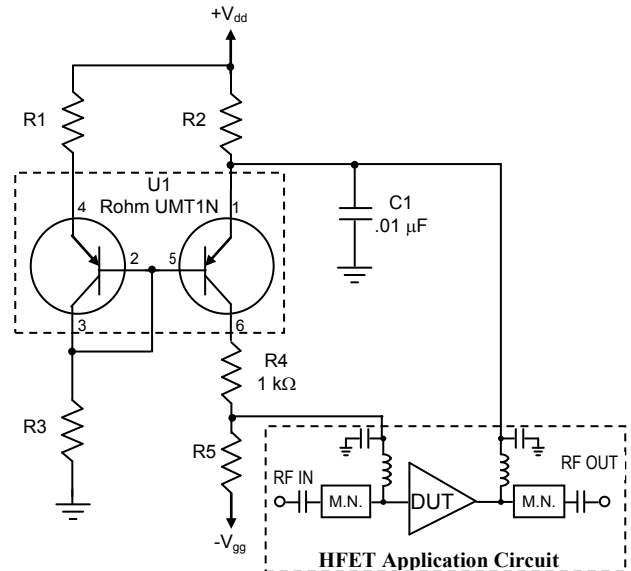

Application Note: Constant-Current Active-Biasing

Special attention should be taken to properly bias the FP31QF. Power supply sequencing is required to prevent the device from operating at 100% I_{dss} for a prolonged period of time and possibly causing damage to the device. It is recommended that for the safest operation, the negative supply be “first on and last off.” With a negative gate voltage present, the drain voltage can then be applied to the device. The gate voltage can then be adjusted to have the device be used at the proper quiescent bias condition.

An optional active-bias current mirror is recommended for use with the application circuits shown this datasheet. Generally in a laboratory environment, the gate voltage is adjusted until the drain draws the recommended operating current. The gate voltage required can vary slightly from device to device because of device pinchoff variation, while also varying slightly over temperature.

The active-bias circuit, shown on the right, uses dual PNP transistors to provide a constant drain current into the FP31QF, while also eliminating the effects of pinchoff variation. This configuration is best suited for applications where the intended output power level of the amplifier is backed off at least 6 dB away from its compression point. With the implementation of the circuit, lower P1dB values may be measured for a Class-AB amplifier, where the device will attempt to source more drain current while the circuit tries to provide a constant drain current. The circuit should be connected directly in line with where the voltage supplies would be normally connected with the amplifier circuit, as shown the diagram. Any required matching circuitry remains the same, although it is not shown in the diagram. This recommended active-bias constant-current circuit adds 7 components to the parts count for implementation, but should cost only an extra \$0.144 to realize (\$0.10 for U1, \$0.0029 for R1, R3, R4, R5, \$0.024 for R2, and \$0.0085 for C1).

Temperature compensation is achieved by tracking the voltage variation with the temperature of the emitter-to-base junction of the two PNP transistors. As a 1st order approximation, this is achieved by using matched transistors with approximately the same I_{be} current. Thus the transistor emitter voltage adjusts the HFET gate voltage so that the device draws a constant current, regardless of the temperature. A Rohm dual transistor - UMT1N - is recommended for cost, minimal board space requirements, and to minimize the variation between the two transistors. Minimizing the variability between the base-to-emitter junctions allow more accuracy in setting the current draw. More details can be found in a separate application note “Active-bias Constant-current Source Recommended for HFETs” found on the WJ website.

Parameter	FP31QF
Pos Supply, Vdd	+9 V
Neg Supply, Vgg	-5 V
Vds	+8.75 V
Ids	450 mA
R1	62 Ω
R2*	0.56 Ω
R3	2 kΩ
R4	1 kΩ
R5	1 kΩ

*R2 should be of size 1206 to dissipate 0.113 Watts. This should be of 1% tolerance. Two 1.1 Ω resistors in parallel of size 0805 can also be used.

FP31QF-F Mechanical Information

This package is lead-free/RoHS-compliant. It is compatible with both lead-free (maximum 260 °C reflow temperature) and leaded (maximum 245 °C reflow temperature) soldering processes. The plating material on the pins is annealed matte tin over copper.

Outline Drawing

Mounting Configuration / Land Pattern

Product Marking

The component will be lasermarked with a "FP31FF" product label with an alphanumeric lot code on the top surface of the package. The obsolete tin-lead package is marked with an "FP31QF" designator followed by an alphanumeric lot code.

Tape and reel specifications for this part will be located on the website in the "Application Notes" section.

ESD / MSL Information

Caution! ESD sensitive device.

ESD Rating: Class 1C
 Value: Passes $\geq 1000V$ to $<2000V$
 Test: Human Body Model (HBM)
 Standard: JEDEC Standard JESD22-A114

ESD Rating: Class IV
 Value: Passes $\geq 1000V$
 Test: Charged Device Model (CDM)
 Standard: JEDEC Standard JESD22-C101

MSL Rating: Level 2 at +260 °C convection reflow
 Standard: JEDEC Standard J-STD-020

Functional Pin Layout

Pin	FUNCTION
3	Gate /RF Input
19	Drain / RF Output

The backside paddle is the Source and should be grounded for thermal and electrical purposes. All other pins should be grounded on the PCB.
