# Negative Adjustable Regulator 

## feATURES

- Guaranteed 1\% Initial Voltage Tolerance
- Guaranteed 0.01\%/V Line Regulation
- Guaranteed 0.5\% Load Regulation
- Guaranteed 0.02\%/W Thermal Regulation
- 100\% Burn-in in Thermal Limit

## APPLICATIONS

- Adjustable Power Supplies
- System Power Supplies
- Precision Voltage/Current Regulators
- On-Card Regulators

## DESCRIPTIOn

The LT ${ }^{\circledR 137 A / L T 337 A ~ n e g a t i v e ~ a d j u s t a b l e ~ r e g u l a t o r s ~ w i l l ~}$ deliver up to 1.5 A output current over an output voltage range of -1.2 V to -37 V . Linear Technology has made significant improvements in these regulators compared to previous devices, such as better line and load regulation, and a maximum output voltage error of $1 \%$.

Every effort has been made to make these devices easy to use and difficult to damage. Internal current and power limiting coupled with true thermal limiting prevents device damage due to overloads or shorts, even if the regulator is not fastened to a heat sink.

Maximum reliability is attained with Linear Technology's advanced processing techniques combined with a $100 \%$ burn-in in the thermal limit mode. This assures that all device protection circuits are working and eliminates field failures experienced with other regulators that receive only standard electrical testing.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The shaded electrical specifications indicate those parameters which have been improved or guaranteed test limits provided for the first time.
Note 3: Unless otherwise indicated, these specifications apply: $\mid \mathrm{V}_{\mathrm{IN}}$ $-\mathrm{V}_{\text {OUT }}=5 \mathrm{~V}$; and $\mathrm{I}_{\text {OUT }}=0.1 \mathrm{~A}$ for the H package, $\mathrm{I}_{\text {OUT }}=0.5 \mathrm{~A}$ for the $\mathrm{K}, \mathrm{M}$, and $T$ packages. Power dissipation is internally limited. However, these specifications apply for power dissipation up to 2 W for the H package and 20W for the K and $T$ packages. $I_{\mathrm{MAX}}=1.5 \mathrm{~A}$ for the $\mathrm{K}, \mathrm{M}$, and T packages, and 0.2 A for the H package.

Note 4: Testing is done using a pulsed low duty cycle technique. See thermal regulation specifications for output changes due to heating effects. Load regulation is measured on the output pin at a point $1 / 8$ " below the base of the K and H package and at the junction of the wide and narrow portion of the lead on the $M$ and $T$ package.
Note 5: Load regulation for the LT337AT is the same as for LM337T.
Note 6: Guaranteed on LT137A and LT337A, but not 100\% tested in production.
Note 7: ISC is tested at the ambient temperatures of $25^{\circ} \mathrm{C}$ and $-55^{\circ} \mathrm{C}$. ISC cannot be tested at the maximum ambient temperature of $150^{\circ} \mathrm{C}$ due to the high power level required. I IS specification at $150^{\circ} \mathrm{C}$ ambient is guaranteed by characterization and correlation to $25^{\circ} \mathrm{C}$ testing.

## TYPICAL PERFORMANCE CHARACTERISTICS

137A G07

*THE LT137A/LT337A HAS LOAD REGULATION COMPENSATION WHICH MAKES THE TYPICAL UNIT READ CLOSE TO ZERO. THIS BAND REPRESENTS THE TYPICAL PRODUCTION SPREAD.

## APPLICATIONS INFORMATION

## Output Voltage

The output voltage is determined by two external resistors, R1 and R2 (see Figure 1). The exact formula for the output voltage is:

$$
V_{\text {OUT }}=V_{\text {REF }}\left(1+\frac{R 2}{R 1}\right)+I_{\text {ADJ }}(R 2)
$$

Where: $\mathrm{V}_{\text {REF }}=$ Reference Voltage, $\mathrm{I}_{\text {ADJ }}=$ Adjustment Pin Current. In most applications, the second term is small enough to be ignored, typically about $0.5 \%$ of $\mathrm{V}_{\text {OUT }}$ In more critical applications, the exact formula should be used, with $\mathrm{I}_{\text {ADJ }}$ equal to $65 \mu \mathrm{~A}$. Solving for R 2 yields:

$$
R 2=\frac{V_{0 U T}-V_{\text {REF }}}{\frac{V_{\text {REF }}}{R 1}+I_{\text {ADJ }}}
$$

Smaller values of R1 and R2 will reduce the influence of $I_{\text {ADJ }}$ on the output voltage, but the no-load current drain on the regulator will be increased. Typical values for R1 are between $100 \Omega$ and $300 \Omega$, giving 12.5 mA and 4.2 mA no-load current respectively. There is an additional consideration in selecting R1, the minimum load current specification of the regulator. The operating current of the LT137A flows from input to output. If this current is not absorbed by the load, the output of the regulator will rise above the regulated value. The current drawn by R1 and R2 is normally high enough to absorb the current, but care must be taken in no-load situations where R1 and R2 have high values.

The maximum value for the operating current, which must be absorbed, is 5 mA for the LT137A. If input-output voltage differential is less than 10 V , the operating current that must be absorbed drops to 3 mA .

Figure 1

## EXAMPLES:

1. A precision 10 V regulator to supply up to 1 A load current.
a. Select $R 1=100 \Omega$ to minimize effect of $I_{\text {ADJ }}$
b. Calculate R2 =

$$
\frac{V_{\text {OUT }}-V_{\text {REF }}}{\frac{V_{\text {REF }}}{R 1}+I_{\text {ADJ }}}=\frac{10 \mathrm{~V}-1.25 \mathrm{~V}}{\frac{1.25 \mathrm{~V}}{100 \Omega}+65 \mu \mathrm{~A}}=696.4 \Omega
$$

Use R2 $=698 \Omega$
2. A 15 V regulator to run off batteries and supply 50 mA . $\mathrm{V}_{\text {IN }}$ MAX $=25 \mathrm{~V}$
a. To minimize battery drain, select R1 as high as possible

$$
\mathrm{R} 1=\frac{1.25 \mathrm{~V}}{3 \mathrm{~mA}}=417 \Omega \text {, use } 402 \Omega, 1 \%
$$

b. The high value for R1 will exaggerate the error due to $I_{\text {ADJ }}$, so the exact formula to calculate R 2 should be used.

$$
R 2=\frac{V_{\text {OUT }}-V_{\text {REF }}}{\frac{V_{\text {REF }}}{R 1}+I_{\text {ADJ }}}=\frac{15 \mathrm{~V}-1.25 \mathrm{~V}}{\frac{1.25 \mathrm{~V}}{402 \Omega}+65 \mu \mathrm{~A}}=4331 \Omega
$$

Use R2 $=4320 \Omega$

## Capacitors and Protection Diodes

An output capacitor, C3, is required to provide proper frequency compensation of the regulator feedbackloop. A $1 \mu \mathrm{~F}$ or larger solid tantalum capacitor is generally sufficient for this purpose if the 1 MHz impedance of the capacitor is $2 \Omega$ or less. High Q capacitors, such as Mylar, are not recommended because they tend to reduce the phase margin at light load currents. Aluminum electrolytic capacitors may also be used, but the minimum value should be $10 \mu \mathrm{~F}$ to ensure a low impedance at 1 MHz . The output capacitor should be located within a few inches of the regulator to keep lead impedance to a minimum. The following caution should be noted: if the output voltage is greater than 6 V and an output capacitor greater than $20 \mu \mathrm{~F}$ has been used, it is possible to damage the regulator if the input voltage

## APPLICATIONS InFORMATION

becomes shorted, due to the output capacitor discharging into the regulator. This can be prevented by using the diode D1 (see Figure 2) between the input and the output.
The input capacitor, C 2 , is only required if the regulator is more than 4 inches from the raw supply filter capacitor.

## Bypassing the Adjustment Pin

The adjustment pin of the LT137A may be bypassed with a capacitor to ground, C1, to reduce output ripple, noise, and impedance. These parameters scale directly with output voltage if the adjustment pin is not bypassed. A bypass capacitor reduces ripple, noise, and impedance to that of a 1.25 V regulator. In a 15 V regulator, for example, these parameters are improved by $15 \mathrm{~V} / 1.25 \mathrm{~V}=12$ to 1 . This improvement holds only for those frequencies where the impedance of the bypass capacitor is less than R1. Ten microfarads is generally sufficient for 60 Hz power line applications where the ripple frequency is 120 Hz since $X_{C}=130 \Omega$. The capacitor should have a voltage rating at least as high as the output voltage of the regulator. Values larger than $10 \mu \mathrm{~F}$ may be used, but if the output is larger than 25 V , a diode, D 2 , should be added between the output and adjustment pins (see Figure 2).

*D1 PROTECTS THE REGULATOR FROM INPUT SHORTS TO GROUND. IT IS REQUIRED ONLY WHEN C3 IS LARGER THAN 20 4 F AND V V
**D2 PROTECTS THE ADJUST PIN OF THE REGULATOR FROM OUTPUT SHORTS IF C2 IS LARGER THAN $10 \mu \mathrm{~F}$ AND $V_{\text {OUT }}$ IS LARGER THAN -25 V .

## Proper Connection of Divider Resistors

The LT137A has an excellent load regulation specification of $0.5 \%$ and is measured at a point $1 / 8$ from the bottom of the package. To prevent degradation of load regulation, the resistors which set output voltage, R1 and R2, must be connected as shown in Figure 3. Note that the positive side of the load has a true force and sense (Kelvin) connection, but the negative side of the load does not.
R1 should be connected directly to the output lead of the regulator, as close as possible to the specified point $1 / 8$ " from the case. R2 should be connected to the positive side of the load separately from the positive (ground) connection to the raw supply. With this arrangement, Ioad regulation is degraded only by the resistance between the regulator output pin and the load. If R1 is connected to the load, regulation will be degraded.

## Figure 2

## TYPICAL APPLICATIONS

A high stability regulator is illustrated in the application circuit shown to the right. The output stability, load regulation, line regulation, thermal regulation, temperature drift, Iong term drift, and noise can be improved by a factor of 6.6 over the standard regulator configuration. This assumes a zener whose drift and noise is considerably better than the regulator itself. The LM329B has $20 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ maximum drift and about 10 times lower noise than the regulator.
In the application shown below, regulators \#2 to "N" will track regulator \#1 to within $\pm 24 \mathrm{mV}$ initially, and to $\pm 60 \mathrm{mV}$ over all load, line, and temperature conditions. If any regulator output is shorted to ground, all other outputs will drop to approximately $\approx-2 \mathrm{~V}$. Load regulation of regulators 2 to " N " will be improved by $\mathrm{V}_{\text {OUT }} / 1.25 \mathrm{~V}$ compared to a standard regulator, so regulator \#1 should be the one which has the lowest load current.

Multiple Tracking Regulators

High Stability Regulator

Dual Tracking Supply $\pm 1.25 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$

*SOLID TANTALUM
**R1 OR R5 MAY BE TRIMMED SLIGHTLY TO IMPROVE TRACKING

## PACKAGE DESCRIPTION

## OBSOLETE PACKAGES

## H Package

3-Lead TO-39 Metal Can
(Reference LTC DWG \# 05-08-1330)

LLEAD DIAMETER IS UNCONTROLLED BETWEEN THE REFERENCE PLANE AND . $050^{\circ}$ BELOW THE REFERENCE PLANE
**FOR SOLDER DIP LEAD FINISH, LEAD DIAMETER IS $\frac{.016-.024}{(0.406-0.610)}$
K Package
2-Lead TO-3 Metal Can
(Reference LTC DWG \# 05-08-1310)

PACKAGE DESCRIPTION

M Package<br>3-Lead Plastic DD Pak

(Reference LTC DWG \# 05-08-1460)

recommended solder pad layout

1. DIMENSIONS IN INCH/(MILLIMETER)
2. DRAWING NOT TO SCALE

RECOMMENDED SOLDER PAD LAYOUT FOR THICKER SOLDER PASTE APPLICATIONS

T Package
3-Lead Plastic TO-220
(Reference LTC DWG \# 05-08-1420)
