

FEATURES

- Differential or Single-Ended Gain Block (Adjustable)
- -3dB Bandwidth, $A_V = \pm 2$: 50MHz
- Slew Rate: 165V/ μ s
- Low Supply Current: 13mA
- Output Current: ± 20 mA
- CMRR at 10MHz: 40dB
- LT1193 Pin Compatible
- Low Cost
- Single 5V Operation
- Drives Cables Directly
- Output Shutdown
- Available in 8-Lead PDIP and SO Packages

APPLICATIONS

- Line Receivers
- Video Signal Processing
- Cable Drivers
- Tape and Disc Drive Systems

DESCRIPTION

The LT[®]1187 is a difference amplifier optimized for operation on ± 5 V, or a single 5V supply and gain ≥ 2 . This versatile amplifier features uncommitted high input impedance (+) and (-) inputs, and can be used in differential or single-ended configurations. Additionally, a second set of inputs give gain adjustment and DC control to the difference amplifier.

The LT1187's high slew rate, 165V/ms, wide bandwidth, 50MHz, and ± 20 mA output current require only 13mA of supply current. The shutdown feature reduces the power dissipation to a mere 15mW and allows multiple amplifiers to drive the same cable.

The LT1187 is a low power version of the popular LT1193, and is available in 8-pin miniDIPs and SO packages. For applications with gains of 10 or more, see the LT1189 data sheet.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted continuously.

Note 3: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formulas:

$$\text{LT1187MJ8, LT1187CJ8: } T_J = T_A + (P_D \cdot 100^{\circ}\text{C/W})$$

$$\text{LT1187CN8: } T_J = T_A + (P_D \cdot 100^{\circ}\text{C/W})$$

$$\text{LT1187CS8: } T_J = T_A + (P_D \cdot 150^{\circ}\text{C/W})$$

Note 4: When $R_L = 1\text{k}$ is specified, the load resistor is $R_{FB1} + R_{FB2}$, but when $R_L = 300\Omega$ is specified, then an additional 430Ω is added to the output such that $(R_{FB1} + R_{FB2})$ in parallel with 430Ω is $R_L = 300\Omega$.

Note 5: V_{OS} measured at the output (Pin 6) is the contribution from both input pair and is input referred.

Note 6: $V_{IN\text{ LIM}}$ is the maximum voltage between $-V_{IN}$ and $+V_{IN}$ (Pin 2 and Pin 3) for which the output can respond.

Note 7: Slew rate is measured between $\pm 0.5\text{V}$ on the output, with a V_{IN} step of $\pm 0.75\text{V}$, $A_V = 3$ and $R_L = 1\text{k}$.

Note 8: Full power bandwidth is calculated from the slew rate measurement: $\text{FPBW} = \text{SR}/2\pi V_P$.

Note 9: Settling time measurement techniques are shown in "Take the Guesswork Out of Settling Time Measurements," EDN, September 19, 1985.

Note 10: NTSC (3.58MHz).

Note 11: AC parameters are 100% tested on the ceramic and plastic DIP packaged parts (J8 and N8 suffix) and are sample tested on every lot of the SO packaged parts (S8 suffix).

Note 12: See Application section for shutdown at elevated temperatures. Do not operate shutdown above $T_J > 125^{\circ}\text{C}$.

APPLICATIONS INFORMATION

The primary use of the LT1187 is in converting high speed differential signals to a single-ended output. The LT1187 video difference amplifier has two uncommitted high input impedance (+) and (-) inputs. The amplifier has another set of inputs which can be used for reference and feedback. Additionally, this set of inputs give gain adjust and DC control to the difference amplifier. The voltage gain of the LT1187 is set like a conventional operational amplifier. Feedback is applied to Pin 8, and it is optimized for gains of 2 or greater. The amplifier can be operated single-ended by connecting either the (+) or (-) inputs to the +/REF (Pin 1). The voltage gain is set by the resistors: $(R_{FB} + R_G)/R_G$.

Like the single-ended case, the differential voltage gain is set by the external resistors: $(R_{FB} + R_G)/R_G$. The maximum input differential signal for which the output will respond is approximately $\pm 0.38V$.

Power Supply Bypassing

The LT1187 is quite tolerant of power supply bypassing. In some applications a 0.1 μ F ceramic disc capacitor placed 1/2 inch from the amplifier is all that is required. In applications requiring good settling time, it is important to use multiple bypass capacitors. A 0.1 μ F ceramic disc in parallel with a 4.7 μ F tantalum is recommended.

Calculating the Output Offset Voltage

Both input stages contribute to the output offset voltage at Pin 6. The feedback correction forces balance in the input stages by introducing an input V_{OS} at Pin 8. The complete expression for the output offset voltage is:

$$V_{OUT} = (V_{OS} + I_{OS}(R_S) + I_B(R_{REF})) \cdot (R_{FB} + R_G)/R_G + I_B(R_{FB})$$

R_S represents the input source resistance, typically 75 Ω , and R_{REF} represents the finite source impedance from the DC reference voltage, for V_{REF} grounded, $R_{REF} = 0\Omega$. The I_{OS} is normally a small contributor and the expression simplifies to:

$$V_{OUT} = V_{OS}(R_{FB} + R_G)/R_G + I_B(R_{FB})$$

If R_{FB} is limited to 1k the last term of the equation contributes only 2mV, since I_B is less than 2 μ A.

Figure 1. Simplified Input Stage Schematic

APPLICATIONS INFORMATION

Operating with Low Closed-Loop Gains

The LT1187 has been optimized for closed-loop gains of 2 or greater. For a closed-loop gain of 2 the response peaks about 2dB. Peaking can be eliminated by placing a capacitor across the feedback resistor, (feedback zero). This peaking shows up as time domain overshoot of about 25%.

Closed-Loop Voltage Gain vs Frequency

Small-Signal Transient Response

Small-Signal Transient Response

Extending the Input Range

Figure 1 shows a simplified schematic of the LT1187. In normal operation REF, Pin 1, is grounded or taken to a DC offset control voltage and differential signals are applied between Pins 2 and 3. The input responds linearly until all of the 345 μ A current flows through the 1.1k resistor and Q1 (or Q2) turns off. Therefore the maximum input swing is 380mV_{P-P} or 760mV_{P-P}. The second differential pair, Q3 and Q4, is running at slightly larger current so that when the first input stage limits, the second stage remains biased to maintain the feedback.

Occasionally it is necessary to handle signals larger than 760mV_{P-P} at the input. The LT1187 input stage can be tricked to handle up to 1.5V_{P-P}. To do this, it is necessary to ground Pin 3 and apply the differential input signal between Pins 1 and 2. The input signal is now applied across two 1.1k resistors in series. Since the input signal is applied to both input pairs, the first pair will run out of bias current before the second pair, causing the amplifier to go open loop. The results of this technique are shown in the following scope photo.

APPLICATIONS INFORMATION

LT1187 in Unity Gain

(A) STANDARD INPUTS, PINS 2 TO 3, $V_{IN} = 1.0V_{P-P}$
 (B) EXTENDED INPUTS, PINS 2 TO 2, $V_{IN} = 1.0V_{P-P}$
 (C) EXTENDED INPUTS, PINS 1 TO 2, $V_{IN} = 2.0V_{P-P}$

LT1187 • A106

Using the Shutdown Feature

The LT1187 has a unique feature that allows the amplifier to be shutdown for conserving power, or for multiplexing several amplifiers onto a common cable. The amplifier will shut down by taking Pin 5 to V^- . In shutdown, the amplifier dissipates 15mW while maintaining a true high impedance output state of 20k in parallel with the feedback resistors. For MUX applications, the amplifiers may be configured inverting, noninverting or differential. When the output is loaded with as little 1k from the amplifier's feedback resistors, the amplifier shuts off in 600ns. This shutoff can be under the control of HC CMOS operating between 0V and -5V.

The ability to maintain shutoff is shown on the curve Shutdown Supply Current vs Temperature in the Typical

1MHz Sine Wave Gated Off with Shutdown Pin

$A_V = 2, R_{FB} = R_G = 1k$

LT1187 • A107

Performance Characteristics section. At very high elevated temperature it is important to hold the shutdown pin close to the negative supply to keep the supply current from increasing.

Send Color Video Over Twisted-Pair

With an LT1187 it is possible to send and receive color composite video signals more than 1000 feet on a low cost twisted-pair. A bi-directional "video bus" consists of the LT1195 op amp and the LT1187 video difference amplifier. A pair of LT1195s at Transmit 1 is used to generate differential signals to drive the line which is back-terminated in its characteristic impedance. The LT1187 twisted-pair receiver converts signals from differential to single-ended. Topology of the LT1187 provides for cable compensation at the amplifier's feedback node as shown. In this case, 1000 feet of twisted-pair is compensated with 1000pF and 50Ω to boost the 3dB bandwidth of the system from 750kHz to 4MHz. This bandwidth is adequate to pass a 3.58MHz chroma subcarrier and the 4.5MHz sound subcarrier. Attenuation in the cable can be compensated by lowering the gain set resistor R_G . At Transmit 2, another pair of LT1195s serve the dual function to provide cable termination via low output impedance, and generate differential signals for Transmit 2. Cable termination is made up of a 15Ω and 33Ω attenuator to reduce the differential input signal to the LT1187. Maximum input signal for the LT1187 is 760mV_{P-P}.

1.5MHz Square Wave Input and Unequalized Response Through 1000 Feet of Twisted-Pair

LT1187 • A108

APPLICATIONS INFORMATION

1.5MHz Square Wave Input and Equalized Response Through 1000 Feet of Twisted-Pair

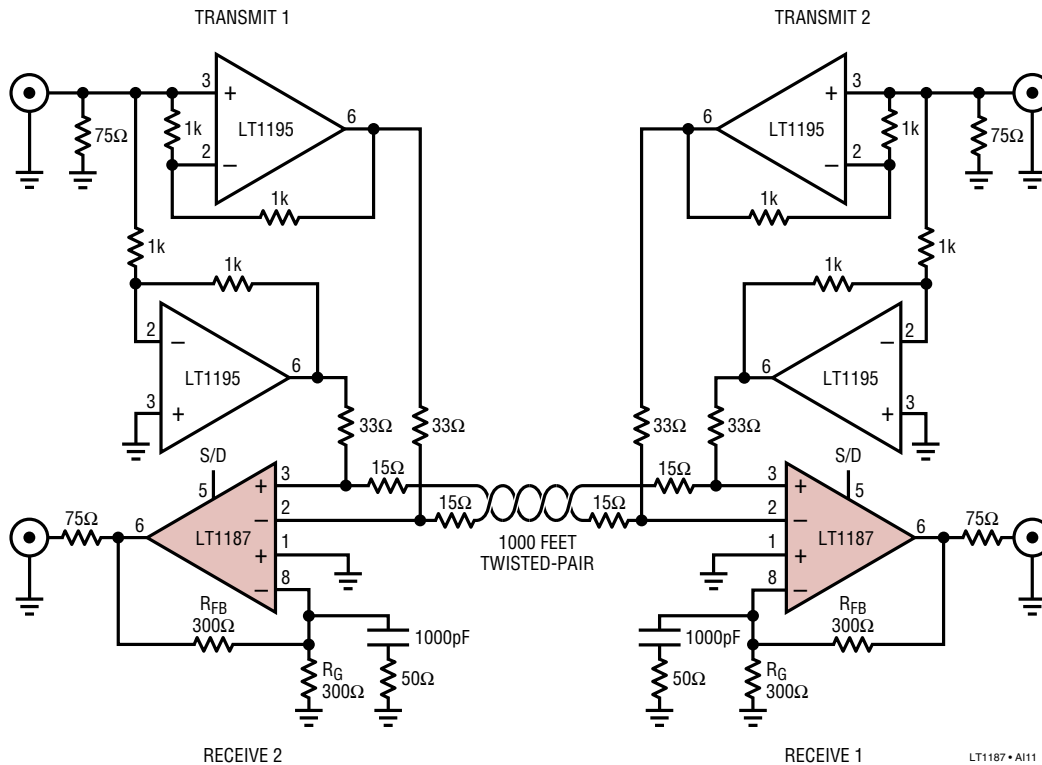

LT1187 • A109

Multiburst Pattern Passed Through 1000 Feet of Twisted-Pair

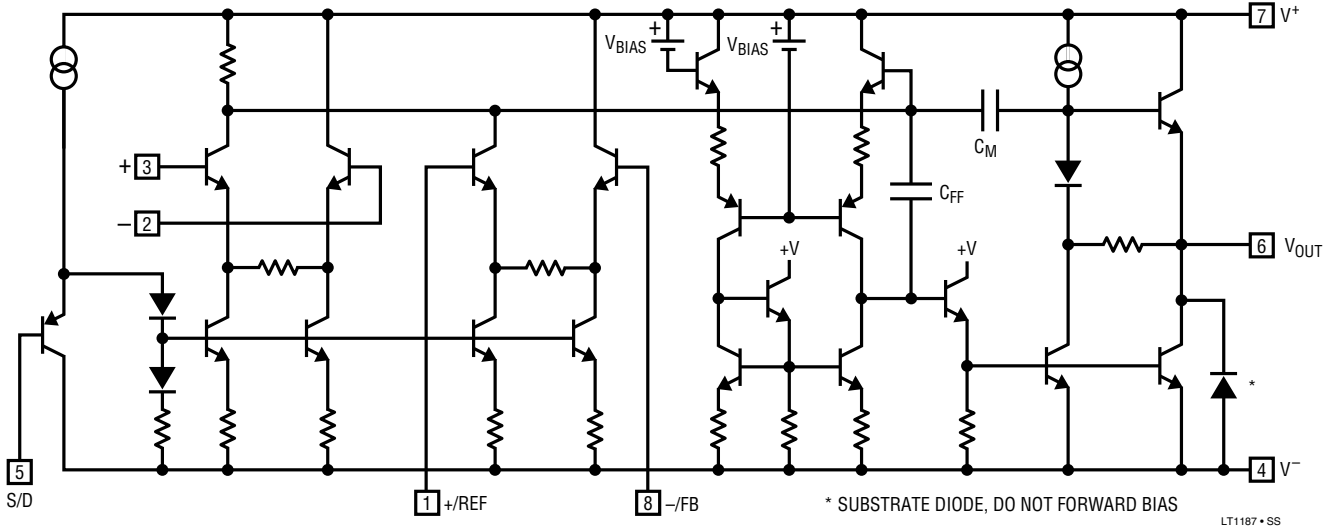

LT1187 • A110

Bi-Directional Video Bus

LT1187 • A111

SIMPLIFIED SCHEMATIC

PACKAGE DESCRIPTION

J8 Package
8-Lead CERDIP (Narrow .300 Inch, Hermetic)
 (Reference LTC DWG # 05-08-1110)

OBsolete PACKAGE

PACKAGE DESCRIPTION

N8 Package
8-Lead PDIP (Narrow .300 Inch)
 (Reference LTC DWG # 05-08-1510)

NOTE:
 1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
 *THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
 MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

N8 1002

PACKAGE DESCRIPTION

S8 Package
8-Lead Plastic Small Outline (Narrow .150 Inch)
 (Reference LTC DWG # 05-08-1610)

- NOTE:
1. DIMENSIONS IN INCHES (MILLIMETERS)
 2. DRAWING NOT TO SCALE
 3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

S08 0303
