## feATURES

- 4.5V to 55V Input Voltage Range
- Up to 50mA LED Current
- 80mA, 55V Switch
- Internal Schottky Diode
- $15 \mu \mathrm{~A}$ Supply Current in Shutdown
- $500 \mu \mathrm{~A}$ Supply Current Operating, Not Switching
- Switching Frequency: 850 kHz
- 200 mV Feedback Voltage with $\pm 5 \%$ Accuracy
- CTRL Input Performs Dimming and Shutdown
- $91 \%$ Efficiency ( 10 LEDs, 50 mA )
- Requires Only $1 \mu \mathrm{~F}$ Output Capacitor
- 8-Lead SC70 Package
- 6-Lead $2 \mathrm{~mm} \times 2 \mathrm{~mm}$ DFN Package

## APPLICATIONS

- LED Fixed Signage
- Traffic Signs
- Neon Sign Replacement

## DESCRIPTIOn

The $\mathrm{LT}{ }^{\circledR} 3590$ is a fixed frequency buck mode converter specifically designed to drive up to 10 LEDs in series from a 48V DC source. Series connection of the LEDs provides identical LED currents of up to 50 mA , resulting in uniform brightness and eliminating the need for ballast resistors. A fixed frequency, current mode architecture results in stable operation over a wide range of input voltage and output voltage.
The high switching frequency of 850 kHz permits the use of tiny, low profile inductors and capacitors. A single pin performs both shutdown and accurate LED dimming control. The power switch, Schottky diode and control circuitry are all contained inside a space saving SC70 package or $2 \mathrm{~mm} \times 2 \mathrm{~mm}$ DFN package to allow a small converter footprint and lower parts cost.

## PIN FUNCTIONS (Sc7open)

SW (Pin 1/Pin 3): Switch Pin. Minimize trace area at this pin to minimize EMI. Connect the inductor at this pin.
GND (Pins 2, 3, 4/Pin 2): Ground Pins. All ground pins should be tied directly to local ground plane. Proper soldering of these pins to the PCB ground is required to achieve the rated thermal performance.
CTRL (Pin 5/Pin 1): Dimming and Shutdown Pin. Connect it below 100 mV to disable the switcher. As the pin voltage is ramped from 0 V to 1.5 V , the feedback voltage $\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {LED }}\right)$ ramps from 0 mV to 200 mV , controlling the LBD current.

VREG (Pin 6/Pin 6): Internally Generated 3.3V Regulated Output Pin. Must be locally bypassed with a $0.1 \mu \mathrm{~F}$ X5R capacitor.

LED (Pin 7/Pin 5): Connection point for the anode of the highest LED and the sense resistor.
$V_{\text {IN }}$ (Pin 8/Pin 4): Input Supply Pin. Must be locally bypassed.

Exposed Pad (NA/Pin 7): Ground. The Exposed Pad should be soldered to the PCB ground to achieve the rated thermal performance.
$I_{\text {LED }}=\frac{V_{I N}-V_{\text {LED }}}{R 1}$

## BLOCK DIAGRAM

Figure 1. Block Diagram

## OPERATION

The LT3590 uses a constant-frequency, current mode control scheme to provide excellent line and load regulation. Operation can be best understood by referring to the Block Diagram.
At power-up, the bandgap reference, the start-up bias, and the regulator are turned on. If CTRL is pulled higher than 150 mV , the switching converter sub-blocks including the oscillator, the PWM comparator and the error amplifier are also turned on. At the start of each oscillator cycle, the power switch Q1 is turned on. Current flows through the inductor and the switch to ground, ramping up as the switch stays on. A voltage proportional to the switch current is added to a stabilizing ramp and the resulting sum is fed into the positive terminal of the PWM comparator. When this voltage exceeds the level at the negative input of the PWM comparator, the PWM logic turns off the power switch. The level at the negative input of the PWM comparator is set by the error amplifier EAMP, and is simply an amplified version of the difference between the $\mathrm{V}_{\text {IN }}$ and $V_{\text {LED }}$ voltage and the bandgap reference. In this manner, the error amplifier sets the correct peak current level in inductor L1 to keep the output in regulation. The CTRL pin is used to adjust the reference voltage.

The LT3590 enters into shutdown when CTRL is pulled lower than 100 mV .

## Input Voltage Range

The minimum input voltage required to generate a particular output voltage in an LT3590 application is limited by either its 4.5 V limit or by its maximum duty cycle. The duty cycle is the fraction of time that the internal switch is on and is determined by the input and output voltages:

$$
D C=\frac{V_{\text {LED }}+V_{D}}{V_{I N}-V_{S W}+V_{D}}
$$

Where $V_{D}$ is the forward voltage drop of the catch diode $(\sim 0.8 \mathrm{~V})$ and $\mathrm{V}_{\text {Sw }}$ is the voltage drop of the internal switch at maximum load $(\sim 0.5 \mathrm{~V})$. Given $\mathrm{DC}_{\mathrm{MAX}}=0.9$, this leads to minimum input voltage of:

$$
V_{\operatorname{IN}(\operatorname{MIN})}=\frac{\left(V_{\mathrm{LED}}+V_{D}\right)}{\mathrm{DC}_{\text {MAX }}}+V_{S W}-V_{D}
$$

The maximum input voltage is limited by the absolute maximum $\mathrm{V}_{\text {IN }}$ rating of 55 V .

## Pulse-Skipping

For LED strings with a low number of LEDs (1, 2, or 3), the LT3590 can drive currents without pulse-skipping as Iong as the voltage across the LED and sense resistor is greater than roughly $15 \%$ of the input supply voltage. If the LED voltage plus sense resistor is less than $15 \%$ of the input supply, the device will begin skipping pulses. This will result in some low frequency ripple, although the LED current remains regulated on an average basis down to zero.

## Discontinuous Current Mode

The CTRL pin, in conjunction with the sense resistor, can be used to program the LED current as discussed under Applications Information. The LT3590 can drive a $10-$ LED string at 10 mA LED current operating in continuous conduction mode, using the recommended external components shown in the front page application circuit with the sense resistor equal to $10 \Omega$. As current is further reduced, the regulator enters discontinuous conduction mode. The photo in Figure 2 details circuit operation driving ten LEDs at 2 mA load. During the discharge phase, the inductor current reaches zero. After the inductor current reaches zero, the SW pin exhibits ringing due to the LC tank circuit formed by the inductor in combination with the switch and the diode capacitance. This ringing is not harmful; far less spectral energy is contained in the ringing than in the switch transitions. The ringing can be damped by application of a $3 \mathrm{k} \Omega$ resistor across the inductor, although this will degrade efficiency.

Figure 2. Switching Waveforms

## APPLICATIONS INFORMATION

Inductor Selection
A $220 \mu \mathrm{H}$ inductor is recommended for most LT3590 applications with $\mathrm{V}_{\mathrm{IN}}<25 \mathrm{~V}$ and $470 \mu \mathrm{H}$ is recommended for applications with $\mathrm{V}_{\text {IN }}>25 \mathrm{~V}$. Although small size and high efficiency are major concerns, the inductor should have low core losses at 850 kHz and low DCR (copper wire resistance). Several manufacturers and inductor series that meet these criteria are listed in Table 1. The efficiency comparison of different inductors is shown in Figure 3.
Table 1. Inductor Manufacturers

## Capacitor Selection

The small size of ceramic capacitors make them ideal for LT3590 applications. X5R and X7R types are recommended because they retain their capacitance over wider voltage and temperature ranges than other types such as Y 5 V or $\mathrm{Z5U}$. A $1 \mu \mathrm{~F}$ input capacitor and a $0.1 \mu \mathrm{~F}$ regulator capacitor are sufficient for most applications. For the output capacitor, $1 \mu \mathrm{~F}$ is generally recommended, but if the voltage across the capacitor exceeds 10 V , a $0.47 \mu \mathrm{~F}$ capacitor may be used instead. For applications driving one or two LEDs a $2.2 \mu \mathrm{~F}$ output capacitor is needed.

Table 2 shows a list of several ceramic capacitor manufacturers. Consult the manufacturers for detailed information on their entire selection of ceramic parts.

## APPLICATIONS INFORMATION

## Programming LED Current

The feedback resistor (R1 in Figure 1) and the sense voltage $\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {LED }}\right)$ control the LED current.

$$
\mathrm{I}_{\mathrm{LED}}=\frac{\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{LED}}}{\mathrm{R} 1}
$$

The CTRL pin controls the sense reference voltage as shown in the Typical Performance Characteristics. For CTRL higher than 1.5 V , the sense reference is 200 mV , which results in full LED current. In order to have accurate LED current, precision resistors are preferred (1\% is recommended). The formula and table for R1 selection are shown below.

$$
\mathrm{R} 1=\frac{200 \mathrm{mV}}{\mathrm{I}_{\mathrm{LED}}}
$$

Table 3. R1 Theoretical Value for 200 mV Sense

| $\mathbf{I}_{\text {LED }}(\mathbf{m A})$ | R1 $(\boldsymbol{\Omega})$ |
| :---: | :---: |
| 10 | 20 |
| 20 | 10 |
| 30 | 6.8 |
| 40 | 5.0 |
| 50 | 4.0 |

## Dimming Control

There are three different types of dimming control circuits. The LED current can be set by modulating the CTRL pin with a DC voltage, a filtered PWM signal or directly with a PWM signal.

Figure 4. Dimming and Shutdown Using CTRL Pin

## Using a DC Voltage

For some applications, the preferred method of brightness control is a variable DC voltage to adjust the LED current. The CTRL pin voltage can be modulated to set the dimming of the LED string. As the voltage on the CTRL pin increases from OV to 1.5 V , the LED current increases from 0 to I LED. As the CTRL pin voltage increases beyond 1.5 V , it has no effect on the LED current.
The LED current can be set by:

$$
\begin{aligned}
& \mathrm{I}_{\text {LED }}=\frac{200 \mathrm{mV}}{R 1} \text {, when } \mathrm{V}_{\text {CTRL }}>1.5 \mathrm{~V} \\
& \mathrm{I}_{\text {LED }}=\frac{\mathrm{V}_{\text {CTRL }}}{6.25 \cdot R 1} \text {, when } \mathrm{V}_{\text {CTRL }}<1.25 \mathrm{~V}
\end{aligned}
$$

Feedback voltage variation versus control voltage is shown in Figure 4.

## Using a Filtered PWM Signal

A variable duty cycle PWM can be used to control the brightness of the LED string. The PWM signal is filtered (Figure 5) by a RC network and fed to the CTRL pin.

The corner frequency of R1, C1 should be much lower than the frequency of the PWM signal. R1 needs to be much smaller than the internal impedance in the CTRL pin which is $100 \mathrm{k} \Omega$.

Figure 5. Dimming Control Using a Filtered PWM Signal

## APPLICATIONS INFORMATION

## Direct PWM Dimming

Changing the forward current flowing in the LEDs not only changes the intensity of the LEDs, it also changes the color. The chromaticity of the LEDs changes with the change in forward current. Many applications cannot tolerate any shift in the color of the LEDs. Controlling the intensity of the LEDs with a direct PWM signal allows dimming of the LEDs without changing the color. In addition, direct PWM dimming offers a wider dimming range to the user.

Dimming the LEDs via a PWM signal essentially involves turning the LEDs on and off at the PWM frequency. The typical human eye has a limit of $\sim 60$ frames per second. By increasing the PWM frequency to $\sim 80 \mathrm{~Hz}$ or higher, the eye will interpret that the pulsed light source is continuously on. Additionally, by modulating the duty cycle (amount of "on-time"), the intensity of the LEDs can be controlled. The color of the LEDs remains unchanged in this scheme since the LED current value is either zero or a constant value.

The time it takes for the LED current to reach its programmed value sets the achievable dimming range for a given PWM frequency. For example, the settling time of the LED current in Figure 6 is approximately $50 \mu$ s for a

Figure 6. Direct PWM Dimming Waveforms

48 V input voltage. The achievable dimming range for this application and 100 Hz PWM frequency can be determined using the following method.

Example:

$$
\begin{aligned}
& f=100 \mathrm{~Hz}, \mathrm{t}_{\mathrm{SETTLE}}=50 \mu \mathrm{~s} \\
& \mathrm{t}_{\text {PERIOD }}=\frac{1}{f}=\frac{1}{100}=0.01 \mathrm{~s} \\
& \text { Dim Range }=\frac{\mathrm{t}_{\text {PERIOD }}}{\mathrm{t}_{\text {SETTLE }}}=\frac{0.01 \mathrm{~s}}{50 \mu \mathrm{~s}}=200: 1 \\
& \text { Min Duty Cycle }=\frac{\mathrm{t}_{\text {SETTLE }}}{\mathrm{t}_{\text {PERIOD }}} \cdot 100=\frac{50 \mu \mathrm{~s}}{0.01 \mathrm{~s}} \cdot 100=0.5 \%
\end{aligned}
$$

Duty Cycle Range $=100 \% \rightarrow 0.5 \%$ at 100 Hz
The calculations show that for a 100 Hz signal the dimming range is 200 to 1 . In addition, the minimum PWM duty cycle of $0.5 \%$ ensures that the LED current has enough time to settle to its final value. Figure 7 shows the dimming range achievable for three different frequencies with a settling time of $50 \mu \mathrm{~s}$.

Figure 7. Dimming Range Comparison of Three PWM Frequencies

## APPLICATIONS INFORMATION

The dimming range can be further extended by changing the amplitude of the PWM signal. The height of the PWM signal sets the commanded sense voltage across the sense resistor through the CTRL pin. In this manner both analog dimming and direct PWM dimming extend the dimming range for a given application. The color of the LEDs no longer remains constant because the forward current of the LED changes with the height of the CTRL signal. For the ten LED application described above, the LEDs can be dimmed first, modulating the duty cycle of the PWM signal. Once the minimum duty cycle is reached, the height of the PWM signal can be decreased below 1.5 V down to 150 mV . The use of both techniques together allows the average LED current for the ten LED application to be varied from 50 mA down to less than $50 \mu \mathrm{~A}$.

## Internal Voltage Regulator

The LT3590 has a 3.3V onboard voltage regulator capable of sourcing up to 1 mA of current for use by an external device. This feature may be used to power-up a controller from the LT3590. The 3.3V is available even during shutdown. It is required to place a $0.1 \mu \mathrm{~F}$ capacitor from $\mathrm{V}_{\text {REG }}$ to ground. The regulator current is limited to 1.5 mA .

## Board Layout Considerations

As with all switching regulators, careful attention must be paid to the PCB board layout and component placement. To prevent electromagnetic interference (EMI) problems, proper layout of high frequency switching paths is essential. Minimize the length and area of all traces connected to the switching node pin (SW). Keep the sense voltage pins ( $\mathrm{V}_{\text {IN }}$ and LED) away from the switching node. Place the output capacitor, C 2 , next to the $\mathrm{V}_{\text {IN }}$ pin. Always use a ground plane under the switching regulator to minimize interplane coupling. Recommended component placement is shown in Figure 8.

| LT3486 | Dual 1.3A, 2MHz High Current LED Driver | $\mathrm{V}_{\text {IN: }}: 2.5 \mathrm{~V}$ to $24.0 \mathrm{~V}, \mathrm{~V}_{\text {OUT(MAX) }}=36.0 \mathrm{~V}$, Dimming 1,000:1 True Color PWM, $I_{\text {SD }}<1 \mu A, 5 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN, TSSOP-16E Package |
| LT3491 | Constant Current, 2.3MHz, High Efficiency White LED Boost Regulator with Integrated Schottky Diode | $\mathrm{V}_{\text {IN: }}$ : 2.5 V to 12.0V, $\mathrm{V}_{\text {OUT(max) }}=27 \mathrm{~V}$, Dimming 300:1 True Color PWM, IsD $<8 \mu A, 2 m m \times 2 m m$ DFN-6, SC70 Package |
| LT3496 | Triple Output $750 \mathrm{~mA}, 2.1 \mathrm{MHz}$ High Current LED Driver with 3,000:1 Dimming | $\mathrm{V}_{\text {IN: }}: 3.0 \mathrm{~V}$ to $30.0 \mathrm{~V}, \mathrm{~V}_{\text {OUT(MAX) }}=40.0$, Dimming 3,000:1 True Color PWM, $I_{S D}<1 \mu A, 4 \mathrm{~mm} \times 5 \mathrm{~mm}$ QFN-28 |
| LT3497 | Dual 2.3MHz, Full Function LED Driver with Integrated Schottkys and 250:1 True Color PWM Dimming | $\mathrm{V}_{\text {IN: }}$ 2.5V to 10.0V, $\mathrm{V}_{\text {OUT(MAX) }}=32$, Dimming 250:1 True Color PWM, $I_{\text {SD }}<12 \mu \mathrm{~A}, 2 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN-10 |
| LT3498 | 20 mA LED Driver and OLED Driver Integrated Schottkys | $\mathrm{V}_{\text {IN }}: 2.5$ to 12.0V, $\mathrm{V}_{\text {OUT(MAX) }}=32$, Dimming Analog/PWM, $\mathrm{I}_{\mathrm{SD}}<8.5 \mu \mathrm{~A}, 2 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN-12 |
| LT3517 | 1.3A, 2.5MHz High Current LED Driver with 3,000:1 Dimming | $\mathrm{V}_{\text {IN: }}$ 3.0V to 30.0V, Dimming 3,000:1 True Color PWM, $\mathrm{ISD}_{\text {SD }}<1 \mu \mathrm{~A}$, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN-16 |
| LT3518 | 2.3A, 2.5MHz High Current LED Driver with 3,000:1 Dimming | $\mathrm{V}_{\text {IN: }}$ 3.0V to 30.0V, Dimming 3,000:1 True Color PWM, ISD $<1 \mu \mathrm{~A}$, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN-16 |
| LT3591 | Constant Current, 1MHz, High Efficiency White LED Boost Regulator with Integrated Schottky Diode and 80:1 True Color PWM Dimming | $\mathrm{V}_{\text {IN }}: 2.5 \mathrm{~V}$ to $12.0 \mathrm{~V}, \mathrm{~V}_{\text {OUT(MAX }}=40$, Dimming 80:1 True Color PWM, $I_{S D}<9 \mu A, 2 m m \times 3 \mathrm{~mm}$ DFN-8 |
