

Y 5V Low Power RS232 3-Driver/5-Receiver Transceiver with 2 Receivers Active in Shutdown

#### **FEATURES**

- Low Supply Current: 300µA
- Two Receivers Kept Alive in Shutdown
- ESD Protection Over ±10kV
- Operates from a Single 5V Supply
- Uses Small Capacitors: 0.1µF
- Operates to 120k Baud
- Three-State Outputs Are High Impedance When Off
- Output Overvoltage Does Not Force Current Back into Supplies
- RS232 I/O Lines Can Be Forced to ±25V Without Damage
- Pin Compatible with LT1137A and LT1237
- Flowthrough Architecture

#### **APPLICATIONS**

- Notebook Computers
- Palmtop Computers

#### DESCRIPTION

The LTC®1349 is a 3-driver/5-receiver RS232 transceiver with very low supply current. In the no load condition, the supply current is only  $300\mu A$ . The charge pump only requires four  $0.1\mu F$  capacitors.

In Shutdown mode, two receivers are kept alive and the supply current is  $35\mu A$ . All RS232 outputs assume a high impedance state in Shutdown and with the power off.

The LTC1349 is fully compliant with all data rate and overvoltage RS232 specifications. The transceiver can operate up to 120k baud with a 2500pF,  $3k\Omega$  load. Both driver outputs and receiver inputs can be forced to  $\pm 25V$  without damage, and can survive multiple  $\pm 10kV$  ESD strikes.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

### TYPICAL APPLICATION

#### 3-Drivers/5-Receivers with Shutdown

## Quiescent and Shutdown Supply Current vs Temperature

#### **ABSOLUTE MAXIMUM RATINGS**

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** Supply current is measured with driver and receiver outputs unloaded.

**Note 3:** Supply current and leakage current measurements in Shutdown are performed with  $V_{ON/\overline{OFF}} = 0V$ .

## TYPICAL PERFORMANCE CHARACTERISTICS

#### TYPICAL PERFORMANCE CHARACTERISTICS

## PIN FUNCTIONS

 $V_{CC}$ : 5V Input Supply Pin. Supply current is typically  $35\mu A$  in the Shutdown mode. This pin should be decoupled with a  $0.1\mu F$  ceramic capacitor.

**GND:** Ground Pin.

**ON/OFF:** TTL/CMOS Compatible Shutdown Pin. A logic low puts the device in Shutdown mode, with receivers 4 and 5 kept alive and the supply current equal to  $35\mu A$ . All driver outputs and other receiver outputs are in high impedance state. This pin can not float.

**V+:** Positive Supply Output (RS232 Drivers).  $V^+ \approx 2V_{CC} - 1V$ . This pin requires an external capacitor  $C = 0.1\mu F$  for charge storage. The capacitor may be tied to ground or 5V.

With multiple devices, the V<sup>+</sup> and V<sup>-</sup> pins may be paralleled into common capacitors. For large numbers of devices, increasing the size of the shared common storage capacitors is recommended to reduce ripple.

**V**<sup>-</sup>: Negative Supply Output (RS232 Drivers).  $V^- \approx 2V_{CC} - 1.5V$ . This pin requires an external capacitor  $C = 0.1 \mu F$  for charge storage.

C1+, C1-, C2+, C2-: Commutating Capacitor Inputs. These pins require two external capacitors  $C = 0.1 \mu F$ : one from C1+ to C1-, and another from C2+ to C2-. To maintain charge pump efficiency, the capacitor's effective series resistance should be less than  $20\Omega$ .

LINEAR

#### PIN FUNCTIONS

**DRIVER IN:** RS232 Driver Input Pins. Inputs are TTL/CMOS compatible. Inputs should not be allowed to float. Tie unused inputs to  $V_{CC}$ .

**DRIVER OUT:** Driver Outputs at RS232 Voltage Levels. Outputs are in a high impedance state when in Shutdown mode or  $V_{CC} = 0V$ . The driver outputs are protected against ESD to  $\pm 10kV$  for human body model discharges.

**RX IN:** Receiver Inputs. These pins can be forced to  $\pm 25$ V without damage. The receiver inputs are protected against ESD to  $\pm 10$ kV for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity.

**RX OUT:** Receiver Outputs with TTL/CMOS Voltage Levels. Receiver 1, 2 and 3 outputs are in a high impedance state when in Shutdown mode to allow data line sharing. Receivers 4 and 5 are kept alive in Shutdown.
